Table of Contents

4 Included VST Audio Effect Plug-ins

- 4 Analyzer Plug-ins
- 28 Delay Plug-ins
- 44 Distortion Plug-ins
- 68 Dynamics Plug-ins
- 88 EQ Plug-ins
- 92 Filter Plug-ins
- 98 Mastering Plug-ins
- 99 Modulation Plug-ins
- 123 Other Plug-ins
- 125 Pitch Shift Plug-ins
- 128 Reverb Plug-ins
- 134 Spatial + Panner Plug-ins
- 137 Tools Plug-ins

139 MIDI Effects

- 139 Arpatche 5
- 141 Arpatche SX
- 143 Auto LFO
- 144 Beat Designer
- 151 Chorder
- 155 Compressor
- 156 Context Gate
- 157 Density
- 158 MIDI Control
- 158 MIDI Echo
- 160 MIDI Modifiers
- 160 MIDI Monitor
- 161 Micro Tuner
- 162 Note to CC
- 162 Quantizer
- 163 StepDesigner
- 166 Track Control
- 169 Transformer

170 Included VST Instruments

171 Index

Included VST Audio Effect Plug-ins

This chapter describes the included VST audio effects and their parameters. How to apply and manage audio effects is described in the **Operation Manual**.

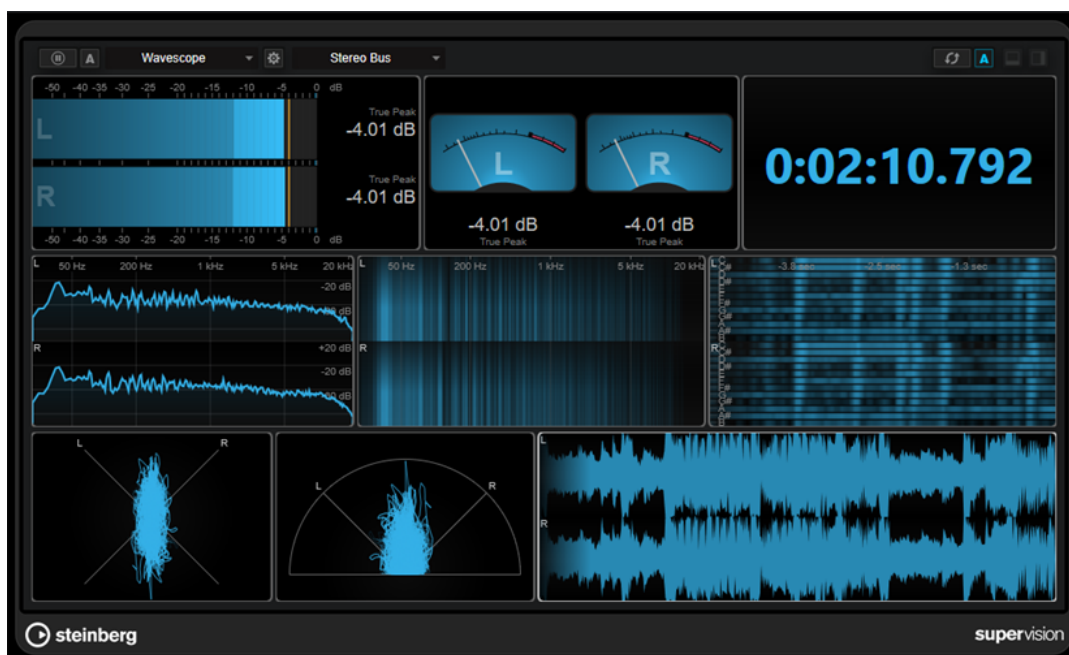

The plug-ins are arranged according to their categories.

Analyzer Plug-ins

SuperVision

SuperVision is a professional tool suite for monitoring and analyzing your audio. The plug-in comes with several different modules for level, spectral, phase, or waveform analysis. Up to nine module slots allow you to create custom layouts for better overview.

SuperVision features two different processing modes: **Maximum Audio Performance** and **Sample-Accurate Display**. You can choose which mode to use for each module independently.

Toolbar

Pause Measurement

Pauses/Continues the measurement for the selected module. **Alt/Opt**-click this button to pause/continue all modules at the same time.

NOTE

- You can also pause/continue the measurement for the selected module by right-clicking it.
 - If a module is paused, you can still adjust the graphical display that holds the last measured values.
 - For all modules that show a playback cursor, you can click in the paused display to set the project cursor to this position. This is not possible during recording.
-

Hold Current Values on Stop

If this button is activated, the last measured values remain in the display when playback is stopped.

Module selector

Allows you to select a module for the selected slot.

Open Module Settings

Opens the **Module Settings** window. It provides the settings for the selected module.

Channel selector

Allows you to select which channels are displayed. The available channel configurations depend on the channel configuration of the track and on the selected module.

Mixdown allows you to display the average value of all channels within the track.

NOTE

- The channel selector is only available for configurations with two or more channels.
 - If side-chain is activated, you can select between **Main** or **Side-Chain** channels. Combined **Main & Side-Chain** views are also available for some modules.
-

Reset Module Values

Resets the measured values of the selected module. **Alt/Opt**-click to reset all modules at the same time.

NOTE

You can also reset the measured values of a module by **Ctrl/Cmd**-clicking it.

Reset Module Values on Start

If this button is activated, all values are automatically reset when you start playback.

Split Horizontally

Splits the selected module slot horizontally.

NOTE

This button is not available if a module is maximized.

Split Vertically

Splits the selected module slot vertically.

NOTE

This button is not available if a module is maximized.

Module Slot Controls

Each module slot shows the following controls in the top right corner if you move the mouse over it:

Remove module slot

Removes the module slot from the current plug-in layout.

Split horizontally

Splits the module slot horizontally.

Split vertically

Splits the module slot vertically.

You can maximize a module by double-clicking it. To downsize it, double-click it again or click the standard view button

If your layout shows more than one module, you can change the focus by clicking a module or pressing **Tab**.

In some modules, for example, **Level**, **Loudness**, or **Time**, you can press **Ctrl/Cmd - S** to copy parameter values as text from the selected module to the clipboard for further use in other applications.

You can show the current frames per second (fps) for all modules by pressing **Alt/Opt - F**.

[Other Modules](#) on page 28

Module Settings Window

In the **Module Settings** window, you can make individual settings for the selected module.

- To open the **Module Settings** window, click **Open Module Settings**

The settings on the **Module Settings** window toolbar are available for all modules:

Reset Settings

Resets all parameter settings to the default values of the selected module.

Maximum Audio Performance/Sample-Accurate Display

Sets the processing mode for the selected module.

If this button is activated, **Maximum Audio Performance** is selected. In this mode, the plug-in has no impact on the audio performance, but the analysis might not be sample-accurate.

If this button is deactivated, **Sample-Accurate Display** is selected. In this mode, no audio sample gets lost for analysis, but the audio performance might be slightly reduced.

NOTE

Sample-Accurate Display is not available for all modules.

Enable Warnings

If this button is activated, a red border around the affected module indicates that the displayed analysis result might not be completely sample-accurate.

NOTE

This setting is only available in **Maximum Audio Performance** mode.

Force Horizontal Display

If this button is activated, the module is always displayed horizontally when you resize it.

NOTE

This setting is not available for all modules.

Force Vertical Display

If this button is activated, the module is always displayed vertically when you resize it.

NOTE

This setting is not available for all modules.

For the specific settings of a module, see the corresponding module description.

Signal Modules

The modules in this category allow you to visualize the level of the audio signal.

The following modules and module-specific settings are available:

Level

This module shows the level of your audio. It provides a multi-channel level meter and a maximum level value display.

The following module-specific settings are available in the **Module Settings** window:

Scale

Allows you to select a scale according to different broadcast standards (**Internal**, **Digital**, **DIN**, **EBU**, **British**, **Nordic**, **K-20**, **K-14**, **K-12**, **+3 dB Digital**, **+6 dB Digital**, or **+12 dB Digital**).

NOTE

You can customize the appearance of the meter for all scales individually in the **Preferences** dialog (**Metering—Appearance** page).

Peak Hold

Specifies for how long the peak levels are held in the display.

Peak Fallback

Sets the speed of release for the level meters and peak indicators.

NOTE

- Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.
 - If this control is turned all the way to the left, the peak indicators are disabled.
-

Threshold

Sets a threshold level below which the display is masked.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Offset

Sets the offset between measured and displayed value in dB.

This parameter is only available for the **DIN**, **EBU**, **British**, and **Nordic** scale.

Clipping

Sets the clipping value for the **Internal** scale.

Minimum

Sets the minimum value for the **Internal** scale.

Maximum

Sets the maximum value for the **Internal** scale.

Color

Sets the color of the meters. You can choose between the **Scale** color and the **Track** color.

RMS AES17

Shows the level in accordance with AES17 (RMS +3 dB).

RMS Resolution

Sets the RMS resolution for the level display in milliseconds.

Max. Value

Sets the measurement mode for the maximum level value display. The following modes are available:

- **True Peak** shows estimated real peak value for each channel.
- **Peak Max.** shows maximum sample value for each channel.
- **RMS Max.** shows the maximum RMS value for each channel.
- **RMS Max. + True Peak** shows the highest maximum RMS and the highest estimated real peak value of all channels.
- **RMS Max. + Peak Max.** shows the highest maximum RMS and the highest maximum sample value of all channels.

VU

This module shows the level of your audio on a classic VU meter. In addition to the VU meter needle and the LED peak indicator, it provides a peak level indicator needle and a numeric maximum level value display.

The following module-specific settings are available in the **Module Settings** window:

Scale

Allows you to select a scale according to different broadcast standards (**Internal**, **Digital**, **DIN**, **EBU**, **British**, **Nordic**, **K-20**, **K-14**, **K-12**, **+3 dB Digital**, **+6 dB Digital**, **+12 dB Digital**, **VU dB**, and **VU dBFS**).

Peak Hold

Specifies for how long the peak levels are held in the display.

Peak Fallback

Sets the speed of release for the level meters and peak indicators.

NOTE

- Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.
- If this control is turned all the way to the left, the peak indicators are disabled.

Meter Mode

Sets the behavior of the needle.

- **VU** mode imitates the physical behavior of an analog VU meter that shows the current peak value.
- **Peak** mode shows the current peak value.
- **RMS** mode shows the current RMS value.

Offset

Sets the offset between measured and displayed value in dB.

This parameter is only available for the **DIN**, **EBU**, **British**, and **Nordic** scale.

Clipping

Sets the clipping value for the **Internal** scale.

Minimum

Sets the minimum value for the **Internal** scale.

Maximum

Sets the maximum value for the **Internal** scale.

Color

Sets the color of the meters. You can choose between the **Track** color and a **Dark** or **Light** scheme.

RMS AES17

Shows the level in accordance with AES17 (RMS + 3 dB).

RMS Resolution

Sets the RMS resolution for the level display in milliseconds.

Max. Value

Sets the measurement mode for the maximum level value display. The following modes are available:

- **True Peak** shows the estimated real peak value for each channel.
- **Peak Max.** shows the maximum sample value for each channel.
- **RMS Max.** shows the maximum RMS value for each channel.
- **RMS Max. + True Peak** shows the highest maximum RMS and the highest estimated real peak value of all channels.
- **RMS Max. + Peak Max.** shows the highest maximum RMS and the highest maximum sample value of all channels.

Level Histogram

This module shows a histogram for the peak or RMS value of the input level.

The following module-specific settings are available in the **Module Settings** window:

Scale

Allows you to select a scale according to different broadcast standards (**Internal**, **Digital**, **DIN**, **EBU**, **British**, **Nordic**, **K-20**, **K-14**, **K-12**, **+3 dB Digital**, **+6 dB Digital**, or **+12 dB Digital**).

Meter Mode

Sets the displayed level value.

- **Peak** mode shows a histogram of the peak value.
- **RMS** mode shows a histogram of the RMS value.

Peak Fallback

Sets the speed of release for the level meters and peak indicators.

NOTE

- If you change this parameter during playback, you must click **Reset Module Values** to update the display.
- Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.
- If this control is turned all the way to the left, the peak indicators are disabled.

Offset

Sets the offset between measured and displayed value in dB.

This parameter is only available for the **DIN**, **EBU**, **British**, and **Nordic** scale.

Clipping

Sets the clipping value for the **Internal** scale.

Minimum

Sets the minimum value for the **Internal** scale.

Maximum

Sets the maximum value for the **Internal** scale.

RMS AES17

Shows the level in accordance with AES17 (RMS +3 dB).

RMS Resolution

Sets the RMS resolution for the level display in milliseconds.

Smooth

Smooths the display of the level curve.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Measurement Modules

The modules in this category allow you to measure the loudness and intelligibility of the audio signal.

The following modules and module-specific settings are available:

Loudness

This module shows the loudness of your audio in LU (Loudness Units) or LUFS (Loudness Units referenced to Full Scale) according to EBU R 128.

TP (True Peak)

Shows the maximum true peak level in dB.

I (Integrated)

Shows the integrated loudness value. This is the average loudness value that is measured over the whole audio range in LU or LUFS.

S (Short-Term)

Shows the short-term loudness value that is measured every second on an audio block of 3 seconds in LU or LUFS. This gives information about the loudest audio passages.

M Max. (Momentary Max.)

Shows the maximum value of all momentary loudness values that are measured every 100 ms in an audio range of 400 ms in LU or LUFS.

R (Range)

Shows the loudness range (LRA) that is measured over the whole audio range in LU.

The loudness range reports the ratio between the loudest and the quietest non-silent sections. The audio is divided into small blocks. There is one audio block every second and each block lasts 3 seconds, so that the analyzed blocks overlap. The top 10 % of the quiet blocks and the top 5 % of the loud blocks are excluded from the final analysis. The calculated loudness range is the ratio between the loudest and quietest remaining audio blocks. This measurement helps you to decide how much compression or expansion must be applied to the audio.

An asterisk (*) after a loudness range value indicates that less than 1 minute of audio was analyzed.

Min. shows the minimum loudness range value in LU. **Max.** shows the maximum loudness range value in LU.

NOTE

EBU R 128 does not recommend loudness range measurement for audio shorter than 1 minute due to too few data points.

PLR (Peak-to-Loudness)

Shows the peak-to-loudness ratio (PLR), also referred to as the crest factor, which is the difference between the maximum true peak level value and the integrated loudness value.

Time

Shows the overall duration of the loudness measurement.

The following module-specific settings are available in the **Module Settings** window:

Unit

Allows you to switch the meter scale between LUFs (absolute values) and LU (relative values).

Scale

Allows you to switch the meter between the EBU +9 scale and the EBU +18 scale.

Ref. Integrated

Sets a reference value for the integrated loudness. If higher values are detected, the loudness meter indicates clipping.

Tol. Integrated

Sets a tolerance value for the integrated loudness.

Ref. True Peak

Sets a reference value for the true peak level. If higher values are detected, the loudness meter indicates clipping.

Tol. True Peak

Sets a tolerance value for the true peak level.

Ref. Short-Term

Sets a reference value for the short-term loudness. If higher values are detected, the loudness meter indicates clipping.

Tol. Short-Term

Sets a tolerance value for the short-term loudness.

Ref. Momentary

Sets a reference value for the maximum momentary loudness. If higher values are detected, the loudness meter indicates clipping.

Tol. Momentary

Sets a tolerance value for the maximum momentary loudness.

Ref. Range

Sets a reference value for the loudness range. If higher values are detected, the loudness meter indicates clipping.

Tol. Range

Sets a tolerance value for the loudness range.

Loudness Histogram

This module shows a histogram for the loudness or the loudness ratio value.

The following module-specific settings are available in the **Module Settings** window:

Unit

Allows you to switch the meter scale between LUFS (absolute values) and LU (relative values).

Scale

Allows you to switch the meter between the EBU +9 scale and the EBU +18 scale.

Meter Mode

Sets the displayed loudness or loudness ratio value.

- **Momentary** mode shows a histogram of the maximum value of all momentary loudness values that are measured every 100 ms in an audio range of 400 ms.
- **Short-Term** shows a histogram of the short-term loudness value that is measured every second on an audio block of 3 seconds.
- **Integrated** shows a histogram of the integrated loudness value.
- **PLR** shows a histogram of the peak-to-loudness ratio, also referred to as the crest factor, which is the difference between the maximum true peak level value and integrated loudness value.
- **PSR** shows a histogram of the peak-to-short-term-loudness ratio according to AES Convention e-Brief 373.

Smooth

Smooths the display of the loudness curve.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Spectral Domain Modules

The modules in this category allow you to visualize spectral information about the audio signal.

The following modules and module-specific settings are available:

Spectrum Curve

This module uses FFT (Fast Fourier Transform) techniques to show a frequency graph, providing a precise and detailed real-time frequency analysis.

The display shows the frequency spectrum as a linear graph. If you move the mouse pointer over the display, a peak curve is shown in orange. Move the mouse pointer over the curves to show the local maximum values in Hz. Press **Ctrl/Cmd** to show the maximum values in dB or press **Shift** to show their pitch.

When using side-chaining, this module also allows you to detect the regions in your main signal that are acoustically masked by the side-chain signal.

NOTE

In addition to the signal of the track, the display can show the signal of a side-chain input. For this to work, you must select a **Main & Side-Chain** view from the channel selector. The side-chain signal is then shown in white.

The following module-specific settings are available in the **Module Settings** window:

Time Smooth

Smooths the temporal display.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter.

Peak Fallback

Sets the speed of release for the spectrum curve and the peak curve.

NOTE

- Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.
 - If this control is turned all the way to the left, the peak curve is disabled.
-

Freq. Smooth

Smooths the frequency display of the spectrum curve.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

FFT Window

Sets the block size of the window that is used for the analysis. If **Multi** is selected, 3 different block sizes are used at the same time.

Minimum

Sets the minimum value of the scale.

Maximum

Sets the maximum value of the scale.

Slope

Adds a slope to the frequency spectrum.

Masking

If this button is activated, frequency ranges that are affected by a side-chain signal are displayed.

NOTE

For this to work, you must activate side-chaining and select a **Main + Side-Chain** channel in the channel selector on the toolbar.

Spectrum Bar

This module shows a graphical representation of the frequency spectrum, analyzed into separate frequency bands, represented as vertical bars.

Move the mouse pointer over a bar to show the frequency range in Hz. Press **Ctrl/Cmd** to show the current value in dB or press **Shift** to show its pitch range.

The following module-specific settings are available in the **Module Settings** window:

Time Smooth

Smooths the temporal display.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter.

Peak Fallback

Sets the speed of release for the level meters and peak indicators.

NOTE

- Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.
 - If this control is turned all the way to the left, the peak indicators are disabled.
-

Threshold

Sets a threshold level below which the display is masked.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Bands/Oct.

Sets the number of bands per octave.

Minimum

Sets the minimum value of the scale.

Maximum

Sets the maximum value of the scale.

Slope

Adds a slope to the frequency spectrum.

Spectrum Intensity

This module represents the frequency magnitude of the audio. The more intensely a bar is colored, the higher the magnitude at this frequency.

The following module-specific settings are available in the **Module Settings** window:

Time Smooth

Smooths the temporal display.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter.

FFT Window

Sets the block size of the window that is used for the analysis. If **Multi** is selected, 3 different block sizes are used at the same time.

Color

Allows you to choose a color scheme.

Minimum

Sets the minimum value of the scale.

Maximum

Sets the maximum value of the scale.

Slope

Adds a slope to the frequency spectrum.

Spectrum Keyboard

This module represents the frequency magnitude of the audio mapped to the keys of a piano keyboard. The more intensely a key is colored, the higher the magnitude at its frequency.

The following module-specific settings are available in the **Module Settings** window:

Time Smooth

Smooths the temporal display.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter.

Color

Allows you to choose a color scheme.

Minimum

Sets the minimum value of the scale.

Maximum

Sets the maximum value of the scale.

Slope

Adds a slope to the frequency spectrum.

Spectrogram

This module shows the last seconds of the audio stream. This allows you to detect disturbances in the spectrogram and to monitor the noise level and frequencies, for example.

NOTE

This module runs in **Maximum Audio Performance** mode.

The following module-specific settings are available in the **Module Settings** window:

FFT Window

Sets the block size of the window that is used for the analysis. This allows you to adjust the trade-off between temporal resolution and frequency resolution. If you specify a higher value, more frequencies are analyzed but they are located less accurately in the time domain.

Duration

Sets the duration of the audio stream that is displayed.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/ Cmd**, and use the mouse wheel to adjust this parameter.

Color

Allows you to choose a color scheme.

Minimum

Sets the minimum value of the scale.

Maximum

Sets the maximum value of the scale.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust the **Minimum** and **Maximum** parameters simultaneously.

Chromagram

This module displays a chromagram of your audio.

NOTE

This module runs in **Maximum Audio Performance** mode.

The following module-specific settings are available in the **Module Settings** window:

Duration

Sets the duration of the audio stream that is displayed.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.

Color

Allows you to choose a color scheme.

Minimum

Sets the minimum value of the scale.

Maximum

Sets the maximum value of the scale.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust the **Minimum** and **Maximum** parameters simultaneously.

Phase Modules

The modules in this category allow you to visualize the phase or directional relationship between the channels of the audio signal.

The following modules and module-specific settings are available:

Phasescope

This module uses a vectorscope display to show the phase and amplitude relationship between the left and right stereo channels. This provides you with directional information about a stereo audio signal.

Hold **Shift** and move the mouse pointer over the display to measure the angle.

NOTE

In addition to the signal of the track, the display can show the signal of a side-chain input. For this to work, you must select a **Main & Side-Chain** view from the channel selector. The side-chain signal is then shown in white.

The following module-specific settings are available in the **Module Settings** window:

Zoom

Allows you to zoom in the graphical display.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Auto Zoom

If this button is activated, the zoom factor is adapted automatically.

Mode

Sets the display mode. The following modes are available: **Lines**, **Dots**, **Envelope**.

Peak Fallback

Sets the speed of release for the peak envelope in **Envelope** mode.

NOTE

If this control is turned all the way to the left, the peak envelope is disabled.

Scale

Activates/Deactivates the axis labeling.

NOTE

This option is only available if **Auto Zoom** is deactivated.

Panorama

This module uses a polar coordinate display to show the phase and amplitude relationship between the left and right stereo channels. This provides you with directional information about a stereo audio signal.

NOTE

In addition to the signal of the track, the display can show the signal of a side-chain input. For this to work, you must select a **Main & Side-Chain** view from the channel selector. The side-chain signal is then shown in white.

The following module-specific settings are available in the **Module Settings** window:

Zoom

Allows you to zoom in the graphical display.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Auto Zoom

If this button is activated, the zoom factor is adapted automatically.

Mode

Sets the display mode. The following modes are available: **Lines**, **Dots**, **Envelope**.

Peak Fallback

Sets the speed of release for the peak envelope in **Envelope** mode.

NOTE

If this control is turned all the way to the left, the peak envelope is disabled.

Scale

Activates/Deactivates the axis labeling.

NOTE

This option is only available if **Auto Zoom** is deactivated.

Multipanorama

This module provides you with frequency-dependent directional information about a stereo audio signal.

The following module-specific settings are available in the **Module Settings** window:

Time Smooth

Sets the time for which an energy impulse is displayed.

Bands/Oct.

Sets the number of bands per octave.

Color

Allows you to choose a color scheme.

Correlation

This module visualizes the phase-correlation between the left and right channel. This allows you, for example, to check the mono compatibility of a stereo recording.

The following module-specific setting is available in the **Module Settings** window:

Time Smooth

Smooths the temporal display of the correlation.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter

Multicorrelation

This module visualizes the phase-correlation between the left and right channel for different frequency bands.

Move the mouse pointer over a bar to display its frequency range in Hz. Hold **Ctrl/Cmd** to display its current value. Hold **Shift** to display its pitch range.

The following module-specific settings are available in the **Module Settings** window:

Time Smooth

Smooths the temporal display of the correlation.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter

Bands/Oct.

Sets the number of bands per octave.

Balance

This module visualizes the balance between the left and right channel.

The following module-specific setting is available in the **Module Settings** window:

Time Smooth

Smooths the temporal display of the correlation.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt**, and use the mouse wheel to adjust this parameter

Waveform Modules

The modules in this category allow you to visualize the waveform of the audio signal.

The following modules and module-specific settings are available:

Oscilloscope

This module shows a highly magnified view of the waveform.

NOTE

In addition to the signal of the track, the display can show the signal of a side-chain input. For this to work, you must select a **Main & Side-Chain** view from the channel selector. The side-chain signal is then shown in white.

The following module-specific settings are available in the **Module Settings** window:

Zoom

Allows you to zoom in the graphical display by adjusting the amplitude.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Alt/Opt**, and use the mouse wheel to adjust this parameter.

Frequency

Allows you to zoom in the graphical display by adjusting the frequency.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/Cmd**, and use the mouse wheel to adjust this parameter.

Trigger

Sets the channel that is used to synchronize the audio signal.

NOTE

Alternatively, you can click the waveform of the corresponding channel.

Scale

Activates/Deactivates the axis labeling.

NOTE

This option is only available if **Auto Zoom** is deactivated.

Phase

Allows you to shift the zero-crossing position.

Wavescope

This module displays the real-time waveform of the audio signal.

Move the mouse pointer over a waveform position to display the corresponding project time.

NOTE

In addition to the signal of the track, the display can show the signal of a side-chain input. For this to work, you must select a **Main & Side-Chain** view from the channel selector. The side-chain signal is then shown in white.

The following module-specific settings are available in the **Module Settings** window:

Zoom

Allows you to zoom in the graphical display.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Duration

Sets the duration of the audio stream that is displayed.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/ Cmd**, and use the mouse wheel to adjust this parameter.

Tempo Sync

If this button is activated, you can set **Duration** in beats.

NOTE

The equivalent duration is limited to a minimum of 0.5 s and a maximum of 30 s.

Scale

Activates/Deactivates the axis labeling.

NOTE

This option is only available if **Auto Zoom** is deactivated.

Station. Cursor

If this button is activated, the waveform moves continuously under the stationary cursor. If this button is deactivated, the waveform is refreshed when the cursor moves over it.

Wavecircle

This module displays the real-time waveform of the audio signal as a circle.

Move the mouse pointer over a waveform position to display the corresponding project time.

NOTE

In addition to the signal of the track, the display can show the signal of a side-chain input. For this to work, you must select a **Main & Side-Chain** view from the channel selector. The side-chain signal is then shown in white.

The following module-specific settings are available in the **Module Settings** window:

Zoom

Allows you to zoom in the graphical display.

NOTE

Alternatively, you can move the mouse pointer over the selected module and use the mouse wheel to adjust this parameter.

Duration

Sets the duration of the audio stream that is displayed.

NOTE

Alternatively, you can move the mouse pointer over the selected module, hold **Ctrl/**
Cmd, and use the mouse wheel to adjust this parameter.

Tempo Sync

If this button is activated, you can set **Duration** in beats.

NOTE

The equivalent duration is limited to a minimum of 0.5 s and a maximum of 30 s.

Reverse

Changes the rotation direction.

Station. Cursor

If this button is activated, the waveform moves continuously under the stationary cursor. If this button is deactivated, the waveform is refreshed when the cursor moves over it.

Other Modules

This category provides a time display.

Time

This module shows the current time position of the project cursor.

NOTE

If the project cursor is located outside the locator range, the color of the time display changes.

The following module-specific setting is available in the **Module Settings** window:

Mode

Allows you to select one of the following display modes: **Time**, **Sample**, **Beats**, or **Timecode**.

Delay Plug-ins

MonoDelay

This is a mono delay effect. The delay line uses tempo-based or freely specified delay time settings.

Lo Filter

Affects the feedback loop of the effect signal and allows you to roll off low frequencies. The button below the control activates/deactivates the filter.

Hi Filter

Affects the feedback loop of the effect signal and allows you to roll off high frequencies. The button below the control activates/deactivates the filter.

Delay

Sets the delay time in milliseconds.

Sync

Activates/Deactivates tempo sync.

Feedback

Sets the amount of the signal that is sent back into the delay input. The higher this value, the higher the number of repeats.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the delay from another signal source. If the side-chain signal exceeds the threshold, the delay repeats are silenced. If the signal drops below the threshold, the delay repeats reappear. For a description of how to set up side-chain routing, see the **Operation Manual**.

MultiTap Delay

MultiTap Delay is a versatile tap effect delay with up to 8 tap repeats that allows you to create and edit taps manually, to create taps by clicking a rhythm, or to create random taps. You can set up separate effect chains for the delay loop, for delay taps, and for the overall delay output, with each chain containing up to 6 different effects.

The plug-in offers predefined sound characters that you can freely customize. The delay line uses either tempo-based or freely specified delay time settings. The integrated ducker attenuates the delay output depending on the input signal level, which keeps the delayed signal rather dry during loud or intensely played passages.

NOTE

This plug-in supports external side-chaining. For a description of how to set up side-chain routing, see the **Operation Manual**.

Delay Character section

This section allows you to shape the overall sound of the delay. You can choose between 4 predefined sound characters and adjust their parameters to your liking.

Show/Hide Delay Character Section

Shows/Hides this section.

Character pop-up menu

Allows you to choose the general delay character. **Digital Modern**, **Digital Vintage**, **Tape**, and **Crazy** character are available. Modifying parameters in this section sets the delay character to **Custom**.

Saturation

Sets the amount of saturation. This effect is inserted into the delay loop, which means that the saturation of the signal is increased with each repeat.

Freq

Sets the frequency of the delay modulation.

Width

Sets the intensity of the delay modulation. If this value is set to 0, the signal is not modulated. Activating **Extreme Modulation** increases the modulation to such an extent that drastic variations in tape speed become audible.

Sample Rate

Sets the ratio to which the audio sample is decimated. Lower sample rates reduce the high frequency content and sound quality. If no button is activated, no downsampling occurs.

Damping

Sets the amount of high-frequency damping in the feedback loop.

Low-Cut

Sets the frequency below which low-frequency damping occurs.

High-Cut

Sets the frequency above which high-frequency damping occurs.

Main section

This section contains the general delay parameters and settings, and allows you to add and edit the delay taps.

Delay

If **Sync** is activated, this sets the base note value for the delay. If **Sync** is deactivated, the delay time can be set freely in milliseconds.

Sync

Activates/Deactivates tempo sync.

Lock/Unlock Delay Value and Number of Taps

Locks/Unlocks the values of the **Delay** and the **Taps** parameters when loading presets.

Erase Delay Line

Erases the delay line.

Feedback

Sets the amount of the signal that is sent back into the delay input. The higher this value, the higher the number of repeats.

Taps display

Allows you to move taps by dragging their handles and to delete them by double-clicking.

- The **Level** tab allows you to set the level of all taps individually.
- The **Panorama** tab allows you to pan the taps individually in the stereo panorama.
- The **Tap Parameters** tab allows you to adjust the parameters of the selected effect module in the **Tap Effects** section. The pop-up menus provide direct access to the effect modules and their parameters.
- **Spread Taps Evenly for Editing**  allows easier editing of taps if they are located very close to each other.

Grid

Sets the quantize grid. Taps are quantized to the grid when added or moved.

NOTE

If you hold **Shift**, you can move taps freely even if a grid is set.

Activate/Deactivate Tapping Mode

Activates/Deactivates tapping mode so that you can click the **Tap Rhythm** button to create taps.

Tap Rhythm

Allows you to create taps by clicking a rhythm with the left mouse button.

Quantize

Quantizes all taps to the grid.

Randomize

Sets a random number of taps and tap parameter settings. The **Random Taps Options** pop-up menu allows you to specify the minimum and maximum number of taps, the timing, the panning range, and the level range of the random function.

Taps

Sets the number of taps.

Link/Unlink Taps

Allows you to move all taps simultaneously in the taps display.

Reset Taps

Resets the number of taps and all tap parameters to the default.

Output meter

Shows the level of the output signal.

Output

Adjusts the overall output level.

Ducker

This effect attenuates the delay output depending on the input signal level. If the level of the input signal is high, the effect signal is lowered, or ducked. If the level of the input signal is low, the effect signal is raised.

- **FB** suppresses feedback when the delay signal is ducked.
- **DL** erases the delay line one time as soon as the ducking of the delay signal starts.
- **Amount** sets the amount of level reduction that is applied to the delay output. The meter to the right shows the current amount of gain reduction.
- **Release** sets the time after which the effect signal returns to the original level.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the ducking effect from another signal source. If the side-chain signal exceeds the threshold, the delay repeats are ducked. If the signal drops below the threshold, the delay repeats reappear. For a description of how to set up side-chain routing, see the **Operation Manual**.

Play Sample Sound

Plays back a sound sample which allows you to quickly evaluate the result of the current plug-in parameter settings.

Spatial

Sets the stereo width for the left/right repeats. Turn clockwise for a more pronounced stereo effect.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Lock/Unlock Mix Value

Locks the value of the **Mix** parameter in the main section when loading presets.

Effects sections

These sections allow you to add, edit, and remove loop, tap, and post effects. You can create effect chains by adding up to 6 different effect modules from 14 effects available overall. You can modify the order of the effects in the chain by dragging the modules.

- Effects in the **Loop Effects** section feed the output signal back into the delay input, allowing for a continuously increasing effect through the loop effect chain.
- Effects in the **Tap Effects** section process the output signal of each delay tap. You can activate/deactivate each effect and set individual parameters for any single tap.
- Effects in the **Post Effects** section affect the overall output signal of the plug-in.

Bypass

Bypasses the effect chain in the corresponding effects section.

Mix

Sets the balance between dry signal and wet signal for the corresponding effect chain.

Loop Effects/Tap Effects/Post Effects

Shows/Hides the corresponding effects section. The section is highlighted if at least one effect module has been added.

Show/Hide Functional Diagram

Shows/Hides a functional diagram of the signal flow for **Loop Effects**, **Tap Effects**, or **Post Effects** in the taps display.

Add Module

Allows you to add modules to the effect chain of the corresponding section.

Tap Effects Options

Opens the options panel for tap effects. **Suspend Effect When Disabled** stops effects from being processed when they are bypassed or deactivated. This reduces the processing load.

IMPORTANT

If this option is activated, crackles may occur when bypassing or activating/deactivating an effect.

Parameter Link (only available in the Tap Effects section)

Links the parameters of the same type in all taps. This allows you to edit parameter values of all taps in a module simultaneously. Two link modes are available:

- If **Absolute Mode** is activated and you edit a parameter value of one tap, the corresponding parameter values of the other taps are set to the same value.
- If **Relative Mode** is activated and you edit a parameter value of one tap, the relation of the corresponding parameter values of the other taps remains the same.

Tap 1-8 (only available in the Tap Effects section)

Allows you to select a tap for editing the effect parameters.

Activate/Deactivate Effect (only available in the Tap Effects section)

Allows you to activate/deactivate the effect for the tap that is selected in the tap display.

RELATED LINKS

[Effect Modules](#) on page 34

Effect Modules

Modules allow you to create an effect chain. Each effect can be used only once in the module chain. You can drag modules in the module chain to rearrange them and change the processing order.

General Effect Settings

The following settings are available for each module:

Bypass

Bypasses the module. This allows you to compare the sound of the unprocessed signal to that of the processed signal.

Solo

Solos the module. Only one module can be soloed at a time.

Remove

Removes the module from the module chain.

The following effect modules are available:

Chorus

This is a single-stage chorus effect that doubles the input signal with a slightly detuned version.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for synchronizing the modulation sweep to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the sweep rate can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Width

Sets the depth of the chorus effect. Higher settings produce a more pronounced effect.

Tone

Changes the tonal characteristic of the output signal.

Mix

Sets the level balance between dry and wet signal.

Flanger

This is a classic flanger effect.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for synchronizing the flanger sweep to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the sweep rate can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Feedback

Determines the character of the flanger effect. Higher settings produce a more metallic-sounding sweep.

Tone

Changes the tonal characteristic of the output signal.

Mix

Sets the level balance between dry and wet signal.

Phaser

This is a classic phasing effect.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for tempo-syncing the phaser sweep (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the sweep rate can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Width

Sets the intensity of the modulation effect between higher and lower frequencies.

Tone

Changes the tonal characteristic of the output signal.

Mix

Sets the level balance between dry and wet signal.

Vibrato

This is a pitch modulation effect.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for tempo-syncing the effect (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the modulation speed can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Depth

Sets the intensity of the pitch modulation.

Spatial

Adds a stereo effect to the modulation.

Envelope Filter

This is a classic envelope filter that allows for auto-wah effects.

Range

Determines the frequency range of the filter. **Sweep Downwards** reverses the filter sweep.

Q-Factor

Sets the intensity of the envelope filter effect.

Sensitivity

Determines how sensitively the effect reacts to the instrument level.

Attack

Determines how quickly an effect reacts to the input signal.

Release

Sets the gain of the release phase of the signal.

Mix

Sets the level balance between dry and wet signal.

Type

Sets the filter type. Low-pass (**LP**), high-pass (**HP**), band-pass (**BP**), and **Notch** filter are available.

Filter

This is a filter modulation effect. The frequency of the filter is modulated by an LFO or you can set it manually.

LFO/Manual buttons

Allows you to select **LFO** and **Manual** mode. In **LFO** mode, you can define the modulation rate or sync it to the project tempo. In **Manual** mode, you can set the frequency manually.

Freq

Sets the filter frequency. This parameter is only available in **Manual** mode.

LFO-Freq

Sets the filter frequency of the LFO modulation. If **Tempo Sync** is activated, this parameter sets the base note value for synchronizing the modulation to the tempo of the host application.

If **Tempo Sync** is deactivated, you can set the frequency freely.

This parameter is only available in **LFO** mode.

Tempo Sync

Activates/Deactivates tempo sync for the **LFO-Freq** parameter. This parameter is only available in **LFO** mode.

Q-Factor

Sets the resonance of the filter.

Type

Sets the filter type. Low-pass (**LP**), high-pass (**HP**), band-pass (**BP**), and **Notch** filter are available.

Low/High

Set the range of the filter frequency modulation.

Bit Crusher

This effect uses bit reduction to decimate and truncate the input audio signal to get a noisy, distorted sound.

Bits (0 to 24 bits)

Defines the bit resolution. A setting of 24 gives the highest audio quality, while a setting of 1 creates mostly noise.

Sample Div.

Sets the amount by which the audio samples are decimated. At the highest setting, nearly all of the information describing the original audio signal is eliminated, turning the signal into unrecognizable noise.

Mode

Allows you to select one of the four operating modes. In each mode, the effect sounds differently. Modes **1** and **3** are nastier and noisier, while modes **2** and **4** are more subtle.

Overdrive

This effect creates a tube-like overdrive effect.

Drive

Adds harmonics to the output signal.

Tone

Works as a filter effect on the added harmonics.

Level

Adjusts the output level.

Pitch Shifter

This is a pitch-shifting effect.

Detune

Changes the pitch of the input signal in semitones.

Formant

Changes the natural timbre of the input signal.

Formant Preservation

Keeps the formants when changing the pitch with the **Detune** control.

Frequency Shifter

This effect shifts each frequency of the input signal by a fixed amount, which alters the harmonic relations. Adding feedback produces a sound similar to a phaser.

Shift

Sets the amount of frequency shift.

Feedback

Sets the amount of the signal that is sent from the output of the effect back to its input.

Mix

Sets the level balance between dry and wet signal.

Delay

This is a mono delay effect that can either be tempo-based or use freely specified delay time settings.

Delay

If **Sync** is activated, this sets the base note value for the delay. If **Sync** is deactivated, the delay time can be set freely in milliseconds.

Sync

Activates/Deactivates tempo sync.

Feedback

Sets the amount of the signal that is sent back into the delay input. The higher this value, the higher the number of repeats.

Mix

Sets the level balance between dry and wet signal.

Reverb

This is a versatile reverb for realistic room ambience and reverb effects.

Pre-Delay

Determines how much time passes before the reverb is applied. This allows you to simulate larger rooms by increasing the time it takes for the first reflections to reach the listener.

Time

Allows you to set the reverb time in seconds.

Size

Alters the delay times of the early reflections to simulate larger or smaller spaces.

Low Level

Affects the decay time of the low frequencies. Normal room reverb decays quicker in the high- and low-frequency range than in the mid-range. Lowering the level percentage causes low frequencies to decay quicker. Values above 100 % cause low frequencies to decay more slowly than the mid-range frequencies.

High Level

Affects the decay time of the high frequencies. Normal room reverb decays quicker in the high- and low-frequency range than in the mid-range. Lowering the level percentage causes high frequencies to decay quicker. Values above 100 % cause high frequencies to decay more slowly than the mid-range frequencies.

Width

Controls the width of the stereo image. At a setting of 0 %, the output of the reverb is mono, at 100 % it is stereo.

Mix

Sets the level balance between dry and wet signal.

AutoPan

This is an auto-pan effect that allows you to modulate the left/right stereo position.

Rate

Sets the auto-pan speed and shows the movement within the panorama. If **Tempo Sync** is deactivated, the speed is set in Hertz. If **Tempo Sync** is activated, you can set the speed in tempo values.

Sync

Activates/Deactivates tempo sync.

Link

If this button is activated, the left and right channel are modulated simultaneously. This results in a chopping effect instead of auto-panning.

In this mode, **Width** sets the intensity of the volume modulation.

Width

Sets the amount of deflection to the left and right side of the stereo panorama. If **Link** is activated, this parameter sets the intensity of the volume modulation.

Waveform Shape

Allows you to select presets for the modulation waveform.

- **Sine** creates a smooth sweep.
- **Triangle** creates a ramp, that is, a linear movement from full right to full left and back.
- **Square** creates an instant jump to full right, then to full left, and then back to center.

Gate

This effect silences audio signals below a set threshold. As soon as the signal level exceeds the threshold, the gate opens to let the signal through.

Threshold

Determines the level at which the gate is activated. Signal levels above the set threshold trigger the gate to open, and signal levels below the set threshold close the gate.

Release

Sets the time after which the gate closes.

RELATED LINKS

[FX Modulator](#) on page 104

PingPongDelay

This is a stereo delay effect that alternates each delay repeat between the left and right channels. The delay line uses tempo-based or freely specified delay time settings.

NOTE

This plug-in works only on stereo tracks.

Lo Filter

Affects the feedback loop of the effect signal and allows you to roll off low frequencies. The button below the control activates/deactivates the filter.

Hi Filter

Affects the feedback loop of the effect signal and allows you to roll off high frequencies. The button below the control activates/deactivates the filter.

Delay

Sets the delay time in milliseconds.

Sync

Activates/Deactivates tempo sync.

Feedback

Sets the amount of the signal that is sent back into the delay input. The higher this value, the higher the number of repeats.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Spatial

Sets the stereo width for the left/right repeats. Turn clockwise for a more pronounced stereo ping-pong effect.

Start Left/Start Right

Determines whether the delay repeat starts on the left or the right channel.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the delay from another signal source. If the side-chain signal exceeds the threshold, the delay repeats are silenced. If the signal drops below the threshold, the delay repeats reappear. For a description of how to set up side-chain routing, see the **Operation Manual**.

StereoDelay

StereoDelay has two independent delay lines which either use tempo-based or freely specified delay time settings.

NOTE

This plug-in works only on stereo tracks.

Feedback

Set the number of repeats for each delay.

Delay

Sets the delay time in milliseconds.

Sync

Activates/Deactivates tempo sync for the corresponding delay.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Lo Filter

Affects the feedback loop of the effect signal and allows you to roll off low frequencies. The button below the control activates/deactivates the filter.

Pan

Sets the stereo position.

Hi Filter

Affects the feedback loop of the effect signal and allows you to roll off high frequencies. The button below the control activates/deactivates the filter.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the delay from another signal source. If the side-chain signal exceeds the threshold, the delay repeats are silenced. If the signal drops below the threshold, the delay repeats reappear. For a description of how to set up side-chain routing, see the **Operation Manual**.

Distortion Plug-ins

AmpSimulator

AmpSimulator is a distortion effect that emulates the sound of various types of guitar amp and speaker cabinet combinations. A wide selection of amp and cabinet models is available.

Select Amplifier Model

This pop-up menu allows you to select an amplifier model. You can bypass this section by selecting **No Amp**.

Drive

Controls the amount of amp overdrive.

Bass

Tone control for the low frequencies.

Mid

Tone control for the mid frequencies.

Treble

Tone control for the high frequencies.

Presence

Boosts or dampens the higher frequencies.

Volume

Controls the overall output level.

Select Cabinet Model

This pop-up menu allows you to select a speaker cabinet model. You can bypass this section by selecting **No Speaker**.

Damping Low/High

These tone controls allow you to shape the sound of the selected speaker cabinet.

BitCrusher

If you are into lo-fi sound, **BitCrusher** is the effect for you. It offers the possibility of decimating and truncating the input audio signal by bit reduction, to get a noisy, distorted sound. For

example, you can make a 24-bit audio signal sound like an 8 or 4-bit signal, or even render it completely garbled and unrecognizable.

Mode

Allows you to select one of the four operating modes. In each mode, the effect sounds differently. Modes **I** and **III** are nastier and noisier, while modes **II** and **IV** are more subtle.

Mix

Sets the level balance between dry and wet signal.

Sample Divider

Sets the amount by which the audio samples are decimated. At the highest setting, nearly all of the information describing the original audio signal is eliminated, turning the signal into unrecognizable noise.

Depth (0 to 24 bits)

Defines the bit resolution. A setting of 24 gives the highest audio quality, while a setting of 1 creates mostly noise.

Output

Sets the output level.

DaTube

DaTube emulates the characteristic warm, lush sound of a tube amplifier.

Mix

Sets the level balance between dry and wet signal.

Drive

Sets the pre-gain of the amplifier. Use high values if you want an overdriven sound just on the verge of distortion.

Output

Sets the output level.

Distortion

Distortion adds crunch to your tracks.

Boost

Increases the distortion amount.

Oversampling

Activates/Deactivates oversampling. Oversampling results in less artifacts for higher distortion.

NOTE

If this parameter is activated, the effect requires more processing power.

Mix

Sets the level balance between dry and wet signal.

Tone

Changes the tonal characteristic of the output signal.

Feedback

Feeds part of the output signal back to the effect input. Higher settings increase the distortion effect.

Spatial

Changes the distortion characteristics of the left and right channels, thus creating a stereo effect.

Output

Sets the output level.

Distroyer

Distroyer adds harmonics to the spectrum and allows for distortion effects from smooth overdrive to extreme clipping.

The following parameters influence only the wet signal:

Lo Filter

Changes the cutoff frequency of the low-pass filter that is applied to the wet signal before it gets distorted.

Hi Filter

Changes the cutoff frequency of the high-pass filter that is applied to the already distorted wet signal.

Offset

Modifies the symmetry of the distortion effect by changing the operation point of the characteristic.

Drive

Changes the characteristic of the distortion effect. Lower values lead to a smooth overdrive-like effect. Higher values change the shape of the signal towards a rectangle, leading to extreme distortion.

Oversampling

Activates/Deactivates oversampling. Oversampling results in less artifacts for higher distortion.

NOTE

If this parameter is activated, the effect requires more processing power.

Spatial

Changes the distortion characteristics of the left and right channels, thus creating a stereo effect.

DC Filter

Removes DC offset that occurs when using high **Offset** values.

The following parameters influence both the dry and the wet signal:

Boost

Increases the distortion amount.

Mix

Sets the level balance between dry and wet signal.

Shelf Freq

Sets the frequency of the high shelving filter.

Shelf Gain

Sets the gain of the high shelving filter.

Tone

Sets the frequency of the output low-pass filter.

Output

Sets the output level.

Grungelizer

Grungelizer adds noise and static to your recordings – like listening to a radio with bad reception, or a worn and scratched vinyl record.

Noise

Sets the amount of added static noise.

Crackle

Adds crackle to create that old vinyl record sound. The speed switch sets the virtual speed of the record in RPM (revolutions per minute).

Distort

Adds distortion.

EQ

Cuts the low frequencies, and creates a hollow, lo-fi sound.

AC

Emulates a constant, low AC hum. The frequency switch sets the virtual frequency of the AC current (50 or 60 Hz), and thus the pitch of the AC hum.

Mix

Sets the amount of overall effect.

Magneto II

Magneto II simulates the saturation and compression of recording on analog tape machines.

Saturation

Determines the amount of saturation and the generation of overtones. This leads to a small increase in input gain.

Saturation On/Off

Activates/Deactivates the saturation effect.

Dual Mode

Simulates the use of two machines.

Frequency Range Low/High

These parameters set the frequency range of the spectrum band to which the tape effect is applied.

For example, to avoid the saturation of lower frequencies, set the **Low** value to 200 Hz or 300 Hz. To avoid the saturation of very high frequencies, set the **High** parameter to values below 10 kHz.

Solo

Allows you to hear only the set frequency range including the tape simulation effect. This helps you to determine the appropriate frequency range.

HF-Adjust

Sets the amount of high frequency content of the saturated signal.

HF-Adjust On/Off

Activates/Deactivates the **HF-Adjust** filter.

Quadrafuzz v2

Quadrafuzz v2 is a multi-band distortion and multi-effect plug-in for processing drums and loops but also for treatment of vocals, for example. You can distort up to 4 bands. 5 different distortion modes with several sub-modes are available.

Frequency Band Editor

The frequency band editor in the upper half of the panel is where you set the width of the frequency bands as well as the output level. The vertical value scale to the left shows the gain level of each frequency band. The horizontal scale shows the available frequency range.

- To define the frequency range of the different frequency bands, use the handles at the sides of each frequency band.
- To attenuate or boost the output level of each frequency band by ± 15 dB, use the handles on top of each frequency band.

Global Settings

SB

Switches between multi band and single band mode.

Scenes

You can save up to 8 different settings. If the default setting of a scene is active, the selected scene button lights up yellow.

If you change the default settings, the button lights up green, indicating that this scene has customized settings.

To copy the settings of a scene to another scene, select the scene that you want to copy, click **Copy**, and click one of the numbered buttons.

You can automate the selection of scenes.

Mix

Sets the level balance between dry and wet signal.

Output (-24 to 24 dB)

Sets the output level.

Band Settings

Mute Band

Mutes/Unmutes a frequency band.

Bypass Band

Bypasses a frequency band.

Solo Band

Solos the corresponding frequency band.

In/Out meter

Display the input and output level.

Gate

Determines the level at which the gate is activated. Signal levels above the set threshold trigger the gate to open, and signal levels below the set threshold close the gate.

Tape

This band mode simulates the saturation and compression of recording on analog tape machines.

Drive

Controls the amount of tape saturation.

Tape Mode Dual

Simulates the use of two machines.

Tube

This band mode simulates the saturation effects using analog tubes.

Drive

Controls the amount of tube saturation.

Tubes

Determine the number of tubes that are simulated.

Dist

This band mode adds distortion to your tracks.

Drive

Controls the amount of distortion.

FBK

Feeds part of the output signal back to the effect input. Higher settings increase the distortion effect.

Amp

This band mode simulates the sound of various types of guitar amps.

Drive

Controls the amount of amp overdrive.

Amp Types

You can select the following types of guitar amps:

- Amp Clean
- Amp Crunch
- Amp Lead

Dec

This band mode allows you to decimate and truncate the input audio signal to create a noisy, distorted sound.

Decimator

Controls the resulting bit-resolution. The lower the resolution, the higher the distortion effect.

Mode

Allows you to select one of the four operating modes. In each mode, the effect sounds differently. Modes **I** and **III** are nastier and noisier, while modes **II** and **IV** are more subtle.

S&H

Sets the amount by which the audio samples are decimated. At the highest setting, nearly all of the information describing the original audio signal is eliminated, turning the signal into unrecognizable noise.

Delay

To open the **Delay** section, click the **Delay** button.

Time

If tempo sync is activated, this is where you specify the base note value for tempo-syncing the effect (1/1 to 1/32, straight, triplet, or dotted).

If tempo sync is deactivated, the delay time can be set freely with the **Time** control.

Sync

Activates/Deactivates tempo sync for the corresponding delay.

Duck

Determines how much the delay signal ducks when an audio signal is present.

Mix

Sets the level balance between dry and wet signal.

FBK

Determines the number of repeats for each delay.

Mode

If this option is activated, the delay signal is routed back into the distortion unit to create a feedback with distortion.

NOTE

High **FBK** values and low **Duck** values in combination with activated **Mode** can lead to unwanted noise.

Slider

Width

Sets the stereo width for the corresponding band.

Out

Sets the output gain for the corresponding band.

Pan

Sets the stereo position for the corresponding band.

Mix

Sets the level balance between dry and wet signal.

VST Amp Rack

VST Amp Rack is a powerful guitar amp simulator. It offers a choice of amplifiers and speaker cabinets that can be combined with stomp box effects.

At the top of the plug-in panel, there are six buttons, arranged according to the position of the corresponding elements in the signal chain. These buttons open different pages in the display section of the plug-in panel: **Pre-Effects**, **Amplifiers**, **Cabinets**, **Post-Effects**, **Microphones**, **Configuration**, and **Master**.

Below the display section, the selected amplifier is shown. The color and texture of the area below the amplifier indicate the selected cabinet.

Pre/Post-Effects

On the **Pre-Effects** and **Post-Effects** pages, you can select up to six common guitar effects. On both pages, the same effects are available, the only difference being the position in the signal chain (before and after the amplifier). On each page, every effect can be used once.

Each effect features an **On/Off** button known from stompbox effects, as well as individual parameters.

Wah Wah

Pedal – Controls the filter frequency sweep.

Volume

Pedal – Controls the level of the signal passing through the effect.

Compressor

Intensity – Sets the amount by which an input signal is being compressed.

Limiter

Threshold – Determines the maximum output level. Signal levels above the set threshold are cut off.

Release – Sets the time after which the gain returns to the original level.

Maximizer

Amount – Determines the loudness of the signal.

Chorus

Rate – Allows you to set the sweep rate. This parameter can be synchronized to the project tempo.

Width – Determines the depth of the chorus effect. Higher settings produce a more pronounced effect.

Phaser

Rate – Allows you to set the sweep rate. This parameter can be synchronized to the project tempo.

Width – Determines the width of the modulation effect between higher and lower frequencies.

Flanger

Rate – Allows you to set the sweep rate. This parameter can be synchronized to the project tempo.

Feedback – Determines the character of the flanger effect. Higher settings produce a more metallic sounding sweep.

Mix – Sets the level balance between the dry signal and the wet signal.

Tremolo

Rate – Allows you to set the modulation speed. This parameter can be synchronized to the project tempo.

Depth – Governs the depth of the amplitude modulation.

Octaver

Direct – Adjusts the mix of the original signal and the generated voices. A value of 0 means only the generated and transposed signal is heard. By raising this value, more of the original signal is heard.

Octave 1 – Adjusts the level of the signal that is generated one octave below the original pitch. A setting of 0 means that the voice is muted.

Octave 2 – Adjusts the level of the signal that is generated two octaves below the original pitch. A setting of 0 means that the voice is muted.

Delay

Delay – Sets the delay time in milliseconds. This parameter can be synchronized to the project tempo.

Feedback – Sets the number of repeats for the delay.

Mix – Sets the level balance between the dry signal and the wet signal.

Tape Delay

Delay – Tape Delay creates a delay effect known from tape machines. The Delay parameter sets the delay time in milliseconds. This parameter can be synchronized to the project tempo.

Feedback – Sets the number of repeats for the delay.

Mix – Sets the level balance between the dry signal and the wet signal.

Tape Ducking Delay

Delay – Tape Ducking Delay creates a delay effect known from tape machines with a ducking parameter. The Delay parameter sets the delay time in milliseconds. This parameter can be synchronized to the project tempo.

Feedback – Sets the number of repeats for the delay.

Duck – Works like an automatic mix parameter. If the level of the input signal is high, the portion of the effect signal is lowered, or ducked (low internal mix value). If the level of the input signal is low, the portion of the effect signal is raised (high internal mix value). This way the delayed signal stays rather dry during loud or intensely played passages.

Overdrive

Drive – Overdrive creates a tube-like overdrive effect. The higher this value, the more harmonics are added to the output signal of this effect.

Tone – Works as a filter effect on the added harmonics.

Level – Adjusts the output level.

Fuzz

Boost – Fuzz creates a rather harsh distortion effect. The higher this value, the more distortion is created.

Tone – Works as a filter effect on the added harmonics.

Level – Adjusts the output level.

Gate

Threshold – Determines the level at which the gate is activated. Signal levels above the set threshold trigger the gate to open, and signal levels below the set threshold close the gate.

Release – Sets the time after which the gate closes.

Equalizer

Low – Sets the level of the low frequency portion of the incoming signal.

Middle – Sets the level of the mid frequency portion of the incoming signal.

High – Sets the level of the high frequency portion of the incoming signal.

Reverb

Type – A convolution-based reverb effect. This parameter allows you to switch between different reverb types (**Studio**, **Hall**, **Plate**, and **Room**).

Mix – Sets the level balance between the dry signal and the wet signal.

Sync Mode

Some parameters can be synchronized to the tempo of the host application.

The names of these parameters are highlighted. Click the corresponding control to activate or deactivate tempo sync. An LED at the top right of the control indicates that sync mode is active. You can then select a base note value for tempo syncing from the pop-up menu above the control.

Using Effects

- To insert a new effect, click the + button that appears if you point the mouse at an empty plug-in slot or at one of the arrows before or after a used effect slot.
- To remove an effect from an effect slot, click the effect name and select **None** from the pop-up menu.
- To change the order of the effects in the chain, click on an effect and drag it to another position.
- To activate or deactivate an effect, click the pedal-like button below the effect name. If an effect is active, the LED next to the button is lit.

NOTE

- Pre-effects and post-effects can be mono or stereo, depending on the track configuration.
 - Using quick controls you can set up an external MIDI device, such as a foot controller, to control the **VST Amp Rack** effects. For more information about quick controls, see the **Operation Manual**.
-

Amplifiers

The amps available on the **Amplifiers** page are modeled on real-life amplifiers. Each amp features settings typical for guitar recording, such as gain, equalizers, and master volume.

Plexi

Classic British rock tone; extremely transparent sound, very responsive.

Plexi Lead

British rock tone of the 70s and 80s.

Diamond

The cutting edge hard rock and metal sounds of the 90s.

Blackface

Classic American clean tone.

Tweed

Clean and crunchy tones; originally developed as a bass amp.

Deluxe

American crunch sound coming from a rather small amp with a big tone.

British Custom

Produces the sparkling clean or harmonically distorted rhythm sounds of the 60s.

All amps provide the following sound-related parameters which have a significant impact on their overall character and sound:

Gain

Sets the amount of boost for the amp.

Bass

Allows you to raise or lower the low frequency part of the signal.

Middle

Allows you to raise or lower the mid frequency part of the signal.

Treble

Allows you to raise or lower the high frequency part of the signal.

Presence

Allows you to raise or lower the upper mid frequency part of the signal.

Master

Sets the output level for the amp.

The different amps keep their settings if you switch models. However, if you want to use the same settings after reloading the plug-in, you need to set up a preset.

Selecting and Deactivating Amplifiers

To switch amps on the **Amplifiers** page, click the model that you want to use. Select **No Amplifier** if you only want to use the cabinets and effects.

Cabinets

The cabinets available on the **Cabinets** page simulate real-life combo boxes or speakers. For each amp, a corresponding cabinet type is available, but you can also combine different amps and cabinets.

Selecting and Deactivating Cabinets

- To switch cabinets on the Cabinets page, click the model that you want to use. Select **No Cabinet** if you only want to use the amps and effects.
- If you select **Link Amplifier & Cabinet Choice**, the plug-in automatically selects the cabinet corresponding to the selected amp model.

Microphones

On the **Microphones** page, you can choose between different microphone positions. These positions result from two different angles (center and edge) and three different distances from the speaker, as well as an additional center position at an even greater distance from the speaker.

You can choose between two microphone types: a large-diaphragm condenser microphone and a dynamic microphone. You can crossfade between the characteristics of the two microphones.

- To select one of the microphone types or blend between the two types, turn the **Mix** control between the two microphones.

Placing the Microphone

- To select a microphone position, click the corresponding ball in the graphic. The selected position is marked in red.

Configuration

On the **Configuration** page, you can specify whether you want to use **VST Amp Rack** in stereo or in mono mode.

- To process the pre-effects, the amplifier, and the cabinets in full stereo mode, make sure that the plug-in is inserted on a stereo track, and activate the **Stereo** button.
- To use the effect in mono-mode, make sure that the plug-in is inserted on a mono track, and activate the **Mono** button.

NOTE

In stereo mode, the effect requires more processing power.

Master

Use the **Master** page to fine-tune the sound.

Input/Output Level Meters

The input and output level meters on the left and the right of the **Master** section show the signal level of your audio. The rectangle on the input meter indicates the optimum incoming level range. In compact view, the input and output levels are indicated by two LEDs at the top left and right.

Using the Master Controls

- To activate/deactivate the equalizer, click the pedal-like **On/Off** button. If the equalizer is active, the LED next to the button is lit.
- To activate/deactivate an equalizer band, click the corresponding **Gain** control. If a band is active, the LED to the left of the **Gain** control is lit.
- To tune your guitar strings, click the pedal-like **On/Off** button to activate the Tuner and play a string. If the correct pitch is displayed and the row of LEDs below the digital display is green, the string is tuned correctly.
If the pitch is too low, red LEDs are lit on the left. If the pitch is too high, red LEDs are lit on the right. The more LEDs are lit, the lower/higher is the pitch.
- To mute the output signal of the plug-in, click the pedal-like **Master** button. If the output is muted, the LED is not lit. Use this to tune your guitar in silence, for example.
- To change the volume of the output signal, use the **Level** control on the **Master** page.

View Settings

You can choose between 2 views: the default view and a compact view, which takes up less screen space.

In the default view, you can use the buttons at the top of the plug-in panel to open the corresponding page in the display section above the amp controls. You can horizontally resize the plug-in panel by clicking and dragging the edges or corners.

In the compact view, the display section is hidden from view. You can change the amp settings and switch amps or cabinets using the mouse wheel.

Using the Smart Controls

Smart controls become visible on the plug-in frame when you move the mouse pointer over on the plug-in panel.

Switching between Default and Compact View

- To toggle between the different views, click the down/up arrow button (Show/Hide Extended Display) at the top center of the plug-in frame.

Changing the Amplifier and Cabinet Selection in the Compact View

In the compact view, a smart control on the lower border of the plug-in frame allows you to select different amplifier and cabinet models.

- To select a different amplifier or cabinet, click the name and select a different model from the pop-up menu.

- To lock the amplifier and cabinet combination, activate the **Link/Unlink Amplifier & Cabinet Choice** button. If you now select another amp model, the cabinet selection follows. However, if you select a different cabinet model, the lock is deactivated.

Previewing Effect Settings

In both views, you can show a preview of the pre- and post-effects that you selected on the corresponding pages:

- Click and hold the **Show Pre-Effects** or **Show Post-Effects** button at the bottom left or right of the plug-in frame.

VST Bass Amp

VST Bass Amp is a bass amp simulator. It offers a choice of amplifiers and speaker cabinets that can be combined with stomp box effects.

At the top of the plug-in panel, the following buttons open different pages in the display section of the plug-in panel: **Pre-Effects**, **Amplifiers**, **Cabinets**, **Post-Effects**, **Microphones**, **Configuration**, and **Master**.

These buttons are arranged according to the position of the corresponding elements in the signal chain.

Below the display section, the selected bass amplifier is displayed. The color and texture of the area below the bass amp indicate the selected cabinet.

Pre/Post-Effects

On the **Pre-Effects** and **Post-Effects** pages, you can select up to six common bass effects. On both pages, the same effects are available, the only difference being the position in the signal chain (before or after the bass amplifier). On each page, every effect can be used once.

Each effect features an **On/Off** button known from stompbox effects, as well as individual parameters.

Wah Wah

Pedal – Controls the filter frequency sweep.

Envelope Filter

Range – Determines the frequency range.

Q-Factor – Sets the intensity of the envelope filter effect.

Sensitivity – Determines how sensitive the effect reacts to the instrument level.

Attack – Determines how quickly an effect reacts to the input signal.

Mix – Sets the level balance between the dry signal and the wet signal.

Type – Sets the filter type.

Release – Determines how quickly the effect fades after the input signal stops.

Volume

Pedal – Controls the level of the signal passing through the effect.

Compressor

Intensity – Sets the amount by which an input signal is being compressed.

Compressor MB

Lo Intensity – Sets the compressor effect in the low frequency band. Activate/deactivate **Auto Makeup Mode** by clicking the LED at the top right of the control.

Hi Intensity – Sets the compressor effect in the high frequency band. Activate/deactivate **Auto Makeup Mode** by clicking the LED at the top right of the control.

Crossover – Determines the crossover frequency between the low frequency band and the high frequency band.

Output – Sets the output level.

Limiter

Threshold – Determines the maximum output level. Signal levels above the set threshold are cut off.

Release – Sets the time after which the gain returns to the original level.

Maximizer

Amount – Determines the loudness of the signal.

Chorus

Rate – Allows you to set the sweep rate. This parameter can be synchronized to the project tempo.

Width – Determines the depth of the chorus effect. Higher settings produce a more pronounced effect.

Tone – Allows you to attenuate low frequencies.

Mix – Sets the level balance between the dry signal and the wet signal.

Phaser

Rate – Allows you to set the sweep rate. This parameter can be synchronized to the project tempo.

Width – Determines the width of the modulation effect between higher and lower frequencies.

Tone – Allows you to attenuate the low frequencies.

Mix – Sets the level balance between the dry signal and the wet signal.

Flanger

Rate – Allows you to set the sweep rate. This parameter can be synchronized to the project tempo.

Feedback – Determines the character of the flanger effect. Higher settings produce a more metallic sounding sweep.

Tone – Allows you to attenuate the low frequencies.

Mix – Sets the level balance between the dry signal and the wet signal.

DI Driver

Level – Sets the output level.

Blend – Blends between normal and tube emulation circuitry. With **Blend** at 0, **Drive** and **Presence** are not active.

Bass – Boosts or attenuates low frequencies.

Treble – Boosts or attenuates high frequencies.

Presence – Boosts or attenuates upper harmonics and attacks.

Drive – Sets gain and overdrive.

Enhancer

Enhance – Simulates the classic enhancer effect.

Tone – Allows you to attenuate low frequencies.

Octaver

Direct – Adjusts the level of the original signal. A value of 0 means only the generated and transposed signal is heard. By raising this value, more of the original signal is heard.

Octave 1 – Adjusts the level of the signal that is generated one octave below the original pitch. A setting of 0 means that the voice is muted.

Tone – Changes the sound character of the generated signal.

Delay

Delay – Sets the delay time in milliseconds. This parameter can be synchronized to the project tempo.

Feedback – The higher this setting, the more delay repeats are created.

Mix – Sets the level balance between the dry signal and the wet signal.

Tape Ducking Delay

Delay – The **Delay** parameter sets the delay time in milliseconds.

Feedback – The higher this setting, the more delay repeats are created.

Duck – Works like an automatic mix parameter. If the level of the input signal is high, the portion of the effect signal is lowered, or ducked (low internal mix value). If the level of the input signal is low, the portion of the effect signal is raised (high internal mix value). This way the delayed signal stays rather dry during loud or intensely played passages.

Tone – Allows you to attenuate the low frequencies.

Mix – Sets the level balance between the dry signal and the wet signal.

Overdrive

Drive – Overdrive creates a tube-like overdrive effect. The higher this value, the more harmonics are added to the output signal of this effect.

Tone – Works as a filter effect on the added harmonics.

Level – Adjusts the output level.

Magneto II

Drive – Controls the amount of tape saturation.

Low/High – These parameters set the frequency range of the spectrum band to which the tape effect is applied.

HF-Adjust – Sets the amount of high frequency content of the saturated signal.

Gate

Threshold – Determines the level at which the gate is activated. Signal levels above the set threshold open the gate and signal levels below the set threshold close the gate.

Release – Sets the time after which the gate closes.

Equalizer

Low – Sets the level of the low frequency portion of the incoming signal.

Middle – Sets the level of the mid frequency portion of the incoming signal.

High – Sets the level of the high frequency portion of the incoming signal.

Graphical EQ

Display – Consists of 8 sliders that set the level of each frequency band. Allows you to draw response curves by clicking and dragging with the mouse.

Reset Sliders – At the lower right of the Display. Flattens all values to 0 dB.

Output Slider – Allows you to control the frequency response.

Reverb

Type – A convolution-based reverb effect. This parameter allows you to switch between the reverb types **Studio**, **Hall**, **Plate**, and **Room**.

Mix – Sets the level balance between the dry signal and the wet signal.

Sync

Some parameters can be synchronized to the tempo of the host application.

The names of these parameters are highlighted. Click the corresponding control to activate or deactivate tempo sync. An LED at the top right of the control indicates that sync mode is active. You can then select a base note value for tempo syncing from the pop-up menu above the control.

Using Effects

- To insert a new effect, click the + button that appears if you point the mouse at an empty plug-in slot or at one of the arrows before or after a used effect slot.

- To remove an effect from an effect slot, click the effect name and select **None** from the pop-up menu.
- To change the order of the effects in the chain, click on an effect and drag it to another position.
- To activate or deactivate an effect, click the pedal-like button below the effect name. If an effect is active, the LED next to the button is lit.

NOTE

- Pre-effects and post-effects can be mono or stereo, depending on the track configuration.
 - Using quick controls you can set up an external MIDI device, such as a foot controller, to control the **VST Bass Amp** effects. For more information about quick controls, see the **Operation Manual**.
-

Amplifiers

The amps available on the **Amplifiers** page are modeled on real-life amplifiers. Each amp features settings typical for bass recording, such as gain, equalizers, and master volume. Shape 1 and Shape 2 offer predefined tone shaping.

ValveAmp300

A famous tube amplifier from the 70s, useful for rock playing styles.

Greyhound

An amplifier, well known for its typical growl, useful for several playing styles.

GreenT

A classic amplifier from the 80s, useful for funk and rock playing styles.

Paradise

An amplifier from the 90s, with a hifi-like clear tone, that makes it applicable for several styles.

Tweed

A classic vintage amplifier from the 50s, with a characterful and bright tone. Originally created for bassists, also used by many guitar players.

iTech

A modern amplifier, with a universal sound.

All amps provide the following sound-related parameters, which have a significant impact on their overall character and sound:

Gain

Sets the amount of boost for the amp.

Bass

Allows you to raise or lower the low frequency part of the signal.

Shape 1

Adds a predefined tone shaping to the low-mid frequency part of the signal.

Lo Mid

Allows you to raise or lower the lower mid frequency part of the signal. The corresponding **Freq** control sets the frequency.

Hi Mid

Allows you to raise or lower the upper mid frequency part of the signal. The corresponding **Freq** control sets the frequency.

Shape 2

Adds a predefined tone shaping to the mid-high frequency part of the signal.

Treble

Allows you to raise or lower the high frequency part of the signal.

Master

Sets the output level for the amp.

The different amps keep their settings if you switch models, but amp settings are lost when closing **VST Bass AMP**. If you want to use the same settings after reloading the plug-in, you need to set up a preset.

Selecting and Deactivating Amplifiers

To switch amps on the **Amplifiers** page, click the model that you want to use. Select **No Amplifier** if you only want to use the cabinets and effects.

NOTE

To scroll through amplifiers, use the mouse wheel when hovering over the amplifier panel.

Cabinets

The cabinets available on the **Cabinets** page simulate real-life combo boxes or speakers. For each amp, a corresponding cabinet type is available, but you can also combine different amps and cabinets.

The following cabinets are available:

4x10"

10" speakers provide a punchy clear sound that is suitable for "Slap" bass and regular playing styles.

10" speakers have a cleaner sound and more punch than 15" speakers.

8x10"

Compared to 4x10", double the amount of speakers.

4x12"

12" speakers provide a mellow and full sound, making them a good choice between 10" and 15" speakers.

1x15"

15" speakers provide more low frequencies compared to the other cabinets. They are suitable for rock and vintage oriented styles.

Selecting and Deactivating Cabinets

- To switch cabinets on the **Cabinets** page, click the model that you want to use. Select **No Cabinet** if you only want to use the amps and effects.
- If you select **Link Amplifier & Cabinet Choice**, the plug-in automatically selects the cabinet corresponding to the selected amp model.

Microphones

On the **Microphones** page, you can choose between different microphone types.

57

Dynamic microphone with cardioid pickup pattern.

121

Ribbon microphone with figure-8 pattern.

409

Dynamic microphone with supercardioid pickup pattern.

421

Dynamic microphone with cardioid polar pattern.

545

Dynamic microphone with cardioid pattern that minimizes feedback.

5

Dynamic microphone with cardioid pickup pattern.

30

Reference and measurement microphone with omni directional polar pattern.

87

Condenser microphone with omni directional pattern.

You can choose between different microphone positions. These positions result from two different angles (on axis and off axis) and three different distances from the cabinet.

You can crossfade between the characteristics of the two microphones.

- To select one of the microphone types or blend between the two types, turn the **Mix** control between the two microphones.
- To select a microphone position, click the corresponding ball in front of the cabinet. The selected position is marked in red.
- To determine the ratio between **line** and **mic**, turn the **Mix** control on the left of the cabinet.

NOTE

To scroll through microphones, use the mouse wheel when hovering over a microphone.

Configuration

On the **Configuration** page, you can specify whether you want to use **VST Bass Amp** in stereo or in mono mode.

- To process the pre-effects, the amplifier, and the cabinets in full stereo mode, make sure that the plug-in is inserted on a stereo track, and activate the **Stereo** button.
- To use the effect in mono-mode, make sure that the plug-in is inserted on a mono track, and activate the **Mono** button.

NOTE

In stereo mode, the effect requires more processing power. Use mono configuration on a stereo track to save processing power.

Master

Use the **Master** page to fine-tune the sound.

Input/Output Level Meters

The input and output level meters on the left and the right of the Master section show the signal level of your audio. The rectangle on the input meter indicates the optimum incoming level range. In all other views, the input and output levels are indicated by two LEDs at the top left and right.

Using the Master Controls

- To activate/deactivate the equalizer, click the pedal-like **On/Off** button. If the equalizer is active, the LED next to the button is lit.
- To activate/deactivate an equalizer band, click the corresponding **Gain** control. If a band is active, the LED to the left of the **Gain** control is lit.
- To tune your guitar strings, click the pedal-like **On/Off** button to activate **Tuner** and play a string. If the correct pitch is displayed and the row of LEDs below the digital display is green, the string is tuned correctly.

If the pitch is too low, red LEDs are lit on the left. If the pitch is too high, red LEDs are lit on the right. The more LEDs are lit, the lower/higher is the pitch.

- To mute the output signal of the plug-in, click the pedal-like **Master** button. If the output is muted, the LED is not lit. Use this to tune your guitar in silence, for example.
- To change the volume of the output signal, use the **Level** control on the **Master** page.
- **NOTE**

Master EQ functions only when a cabinet is selected.

View Settings

You can choose between 2 views: the default view and a compact view, which takes up less screen space.

In the default view, you can use the buttons at the top of the plug-in panel to open the corresponding page in the display section above the amp controls. You can horizontally resize the plug-in panel by clicking and dragging the edges or corners.

In the compact view, the display section is hidden from view. You can change the amp settings and switch amps or cabinets using the mouse wheel.

Using the Smart Controls

Smart controls become visible on the plug-in frame when you move the mouse pointer over the plug-in panel.

Switching between Default and Compact View

- To toggle between the different views, click the down/up arrow button (**Show/Hide Extended Display**) at the top center of the plug-in frame.

Changing the Amplifier and Cabinet Selection in the Compact View

In the compact view, a smart control on the lower border of the plug-in frame allows you to select different amplifier and cabinet models.

- To select a different amplifier or cabinet, click the name and select a different model from the pop-up menu.
- To lock the amplifier and cabinet combination, activate the **Link/Unlink Amplifier & Cabinet Choice** button. If you now select another amp model, the cabinet selection follows. However, if you select a different cabinet model, the lock is deactivated.

Previewing Effect Settings

In both views, you can show a preview of the pre- and post-effects that you selected on the corresponding pages:

- Click and hold the **Show Pre-Effects** or **Show Post-Effects** button at the bottom left or right of the plug-in frame.

Dynamics Plug-ins

Brickwall Limiter

Brickwall Limiter ensures that the output level never exceeds a set limit.

Due to its fast attack time, **Brickwall Limiter** can reduce even short audio level peaks without creating audible artifacts. However, this plug-in creates a latency of 1ms. **Brickwall Limiter** features separate meters for input, output, and the amount of limiting. Position this plug-in at the end of the signal chain, before dithering.

Threshold (-20 to 0 dB)

Determines the level where the limiter kicks in. Only signal levels above the set threshold are processed.

Release (3 to 1000 ms or Auto mode)

Sets the time after which the gain returns to the original level when the signal drops below the threshold. If the **Auto** button is activated, the plug-in automatically finds the best release setting for the audio material.

Link Channels

If this option is activated, the plug-in uses the input from the channel with the highest level. If the option is deactivated, each channel is analyzed separately.

Detect Intersample Clipping

If this option is activated, the plug-in uses oversampling to detect and limit signal levels between two samples to prevent distortion when converting digital signals into analog signals.

NOTE

Brickwall Limiter is designed for the reduction of occasional peaks in the signal. If the **Gain Reduction** meter indicates constant limiting, try raising the threshold or lowering the overall level of the input signal.

NOTE

This plug-in supports external side-chaining. For a description of how to set up side-chain routing, see the **Operation Manual**.

Compressor

Compressor reduces the dynamic range of the audio, making softer sounds louder or louder sounds softer, or both.

Compressor features a separate display that graphically illustrates the compressor curve that is shaped according to the **Threshold** and **Ratio** parameter settings. **Compressor** also features a **Gain Reduction** meter that shows the amount of gain reduction in dB, **Soft knee/Hard knee** compression modes, and a program-dependent auto feature for the **Release** parameter.

Threshold (-60 to 0 dB)

Determines the level where the compressor kicks in. Only signal levels above the set threshold are processed.

Ratio

Sets the amount of gain reduction applied to signals above the set threshold. A ratio of 3:1 means that for every 3 dB the input level increases, the output level increases by 1 dB.

Soft Knee

If this button is deactivated, signals above the threshold are compressed instantly according to the set ratio (hard knee). If **Soft Knee** is activated, the onset of compression is more gradual, producing a less drastic result.

High Ratio

Sets the ratio to a fixed value of 20:1.

Make-Up (0 to 24 dB or Auto mode)

Compensates for output gain loss caused by compression. If **Auto Make-Up Gain** is activated, the output is automatically adjusted for gain loss.

Dry Mix

Mixes the dry input signal to the compressed signal.

Attack (0.1 to 100 ms)

Determines how fast the compressor responds to signals above the set threshold. If the attack time is long, more of the early part of the signal passes through unprocessed.

Hold (0 to 5000 ms)

Sets the time the applied compression affects the signal after exceeding the threshold. Short hold times are useful for DJ-style ducking, while longer hold times are required for music ducking, for example, when working on a documentary film.

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gain returns to its original level when the signal drops below the threshold. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Analysis (Pure Peak to Pure RMS)

Determines whether the input signal is analyzed according to peak or RMS values, or a mixture of both. A value of 0 is pure peak and 100 pure RMS. **RMS** mode operates using the average power of the audio signal as a basis, whereas **Peak** mode operates more on peak levels. As a general guideline, **RMS** mode works better on material with few transients such as vocals, and **Peak** mode works better for percussive material with a lot of transient peaks.

Live

If this button is activated, the look-ahead feature of the effect is deactivated. Look-ahead produces more accurate processing, but adds a specific amount of latency as a trade-off. If **Live** mode is activated, there is no latency, which is better for live processing.

NOTE

This plug-in supports external side-chaining. For a description of how to set up side-chain routing, see the **Operation Manual**.

DeEsser

DeEsser is a special type of compressor that reduces excessive sibilance, primarily for vocal recordings.

You can use it, for example, when close proximity microphone placement and equalizing lead to situations where the overall sound is just right, but where unwanted sibilants occur.

When recording a voice, the position of **DeEsser** in the signal chain is usually after the microphone pre-amp and before a compressor/limiter. This keeps the compressor/limiter from unnecessarily limiting the overall signal dynamics.

Display

Shows the spectrum of the input signal.

- To adjust the frequency band, drag the border lines or click in the middle of the band and drag.
- To change the width of the frequency band, hold **Shift** and drag to the left or right.

Filter

Lo/Hi

Sets the left and right border of the frequency band. You can set the frequency either in Hz or as a note value. If you enter a note value, the frequency is automatically displayed in Hz accordingly. For example, a note value of A3 sets the frequency to 440 Hz. When you enter a note value, you can also enter a cent offset. For example, enter A5 -23 or C4 +49.

NOTE

Make sure that you enter a space between the note and the cent offset. Only in this case, the cent offsets are taken into account.

Solo

Solos the frequency band. This helps you to find the appropriate position and width of that band.

Diff

Plays back what **DeEsser** removed from the signal. This helps you to adjust the frequency band, threshold, and reduction parameters, so that only sharp s-sounds are removed, for example.

Dynamics

Reduction

Controls the intensity of the de-essing effect.

Threshold (-50 to 0 dB)

If the **Auto** option is deactivated, you can use this control to set a threshold for the incoming signal level above which the plug-in starts to reduce the sibilants.

Release (1 to 1000 ms)

Sets the time after which the de-essing effect returns to zero when the signal drops below the threshold.

Auto

Automatically and continually sets an optimum threshold setting independent of the input signal. The **Auto** option does not work for low-level signals (< -30 db peak level). To reduce the sibilants in such a file, set the threshold manually.

Side-Chain

Side-Chain

Activates the internal side-chain filter. You can now shape the input signal according to the filter parameters. Internal side-chaining can be useful for tailoring how the gate operates.

Freq (25 Hz to 20 kHz)

If **Side-Chain** is activated, this sets the frequency of the filter. You can set the frequency either in Hz or as a note value. If you enter a note value, the frequency is automatically displayed in Hz accordingly. For example, a note value of A3 sets the frequency to 440 Hz. When you enter a note value, you can also enter a cent offset. For example, enter A5 -23 or C4 +49.

NOTE

Make sure that you enter a space between the note and the cent offset. Only in this case, the cent offsets are taken into account.

Q-Factor

If **Side-Chain** is activated, this sets the resonance or width of the filter.

Monitor

Allows you to monitor the filtered signal.

Live

If this button is activated, the look-ahead feature of the effect is deactivated. Look-ahead produces more accurate processing, but adds a specific amount of latency as a trade-off. If **Live** mode is activated, there is no latency, which is better for live processing.

NOTE

This plug-in supports external side-chaining. For a description of how to set up side-chain routing, see the **Operation Manual**.

Positioning the DeEsser in the Signal Chain

When recording a voice, the position of **DeEsser** in the signal chain is usually located after the microphone pre-amp and before a compressor/limiter. This keeps the compressor/limiter from unnecessarily limiting the overall signal dynamics.

EnvelopeShaper

EnvelopeShaper can be used to attenuate or boost the gain of the attack and release phase of audio material.

You can use the controls or drag the breakpoints in the graphical display to change parameter values. Be careful with levels when boosting the gain and if needed reduce the output level to avoid clipping.

Attack (-20 to 20 dB)

Sets the gain of the attack phase of the signal.

Length (5 to 200 ms)

Sets the length of the attack phase.

Release

Sets the gain of the release phase of the signal.

Output

Sets the output level.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the effect from another signal source. If the side-chain signal exceeds the threshold, the effect is triggered. For a description of how to set up side-chain routing, see the **Operation Manual**.

Gate

Gating, or noise gating, silences audio signals below a set threshold. As soon as the signal level exceeds the threshold, the gate opens to let the signal through.

Attack (0.1 to 1000 ms)

Sets the time after which the gate opens when it is triggered.

NOTE

Deactivate the **Live** button to make sure that the gate is already open when a signal above the threshold is played back.

Hold (0 to 2000 ms)

Determines how long the gate remains open after the signal drops below the threshold level.

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gate closes after the set **Hold** time. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Threshold

Determines the level at which the gate is activated. Signal levels above the set threshold trigger the gate to open, and signal levels below the set threshold close the gate.

State LED

Indicates whether the gate is open (LED lights up in green), closed (LED lights up in red), or in an intermediate state (LED lights up in yellow).

Analysis (Pure Peak to Pure RMS)

Determines whether the input signal is analyzed according to peak or RMS values, or a mixture of both. A value of 0 is pure peak and 100 pure RMS. **RMS** mode operates using the average power of the audio signal as a basis, whereas **Peak** mode operates more on peak levels. As a general guideline, **RMS** mode works better on material with few transients such as vocals, and **Peak** mode works better for percussive material with a lot of transient peaks.

Range

Adjusts the attenuation of the gate when it is shut. If **Range** is set to minus infinite , the gate is completely shut. The higher the value, the higher the level of the signal that passes through the shut gate.

Live

If this button is activated, the look-ahead feature of the effect is deactivated. Look-ahead produces more accurate processing, but adds a specific amount of latency as a trade-off. If **Live** mode is activated, there is no latency, which is better for live processing.

Side-Chain Section

Side-Chain

Activates the internal side-chain filter. The input signal can then be shaped according to the filter parameters. Internal side-chaining is useful for tailoring how the gate operates.

Monitor

Allows you to monitor the filtered signal.

Center

If **Side-Chain** is activated, this sets the center frequency of the filter.

Q-Factor

If **Side-Chain** is activated, this sets the resonance or width of the filter.

Filter Type (Low-Pass/Band-Pass/High-Pass)

If **Side-Chain** is activated, these buttons allow you to set the filter type to low-pass, band-pass, or high-pass.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the gate from another signal source. If the side-chain signal exceeds the threshold, the gate opens. For a description of how to set up side-chain routing, see the **Operation Manual**.

Limiter

Limiter is designed to ensure that the output level never exceeds a set output level, to avoid clipping in following devices.

Limiter can adjust and optimize the **Release** parameter automatically according to the audio material, or it can be set manually. **Limiter** features separate meters for the input, output and the amount of limiting (middle meters).

Input (-24 to 24 dB)

Sets the input gain.

Release (0.1 to 1000 ms or Auto mode)

Sets the time after which the gain returns to its original level. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Output

Sets the maximum output level.

Maximizer

Maximizer raises the loudness of audio material without the risk of clipping. The plug-in provides two modes, **Classic** and **Modern**, that offer different algorithms and parameters.

Classic

Classic mode provides the classic algorithms from previous versions of this plug-in. This mode is suited for all styles of music.

Modern

In **Modern** mode, the algorithm allows for more loudness than in **Classic** mode. This mode is particularly suited for contemporary styles of music.

Modern mode also provides additional settings to control the release phase:

- **Release** sets the overall release time.
- **Recover** allows for a faster signal recovering at the beginning of the release phase.

Optimize

Determines the loudness of the signal.

Mix

Sets the level balance between dry and wet signal.

Output

Sets the maximum output level.

Soft Clip

If this button is activated, **Maximizer** starts limiting or clipping the signal softly. At the same time, harmonics are generated, adding a warm, tube-like characteristic to the audio material.

MidiGate

This plug-in gates audio signals. The gate is triggered by MIDI notes.

Gating, in its fundamental form, silences audio signals below a set threshold. If a signal rises above the set level, the gate opens to let the signal through. Signals below the set level are silenced. **MidiGate**, however, is not triggered by threshold levels, but MIDI notes. Therefore, it needs both audio and MIDI data to function.

Attack (0 to 500 ms)

Sets the time after which the gate opens when it is triggered.

Hold

Determines how long the gate remains open after a note-on or note-off message. The **Hold Mode** settings are taken into account.

Release (0 to 3000 ms)

Sets the time after which the gate closes after the set **Hold** time.

Note To Attack

Determines to which extent the velocity values of the MIDI notes affect the attack time. The higher the value, the more the attack time increases with high note velocities. Negative values result in shorter attack times with high velocities. If you do not want to use this parameter, set it to 0.

Note To Release

Determines to which extent the velocity values of the MIDI notes affect the release time. The higher the value, the more the release time increases. If you do not want to use this parameter, set it to 0.

Velocity To VCA

Controls to which extent the velocity values of the MIDI notes determine the output volume. At a value of **127**, the volume is controlled entirely by the velocity values, and at a value of **0**, the velocities have no effect on the volume.

Hold Mode

Sets the **Hold Mode**.

- In **Note On** mode, the gate only remains open for the time set with the **Hold** and **Release** parameters, regardless of the length of the MIDI note that triggered the gate.

- In **Note Off** mode, the gate remains open for as long as the MIDI note plays. The **Hold** and **Release** parameters are applied once a note-off signal has been received.

Setting Up MidiGate

To use **MidiGate** for your audio, you need an audio track and a MIDI track.

PROCEDURE

1. Select the audio track to which you want to apply **MidiGate**.
This can be recorded or realtime audio material from any audio track.
 2. Select **MidiGate** as an insert effect for the audio track.
 3. Select a MIDI track to control the **MidiGate** effect.
You can either play notes on a connected MIDI keyboard or use recorded MIDI notes.
 4. Open the **Output Routing** pop-up menu for the MIDI track and select **MidiGate**.
-

Applying MidiGate

PREREQUISITE

Set up the plug-in properly.

How to apply **MidiGate** depends on whether you are using realtime or recorded MIDI. We assume for the purposes of this manual that you are using recorded audio and play the MIDI in realtime.

PROCEDURE

1. If you use realtime MIDI to trigger the plug-in, make sure the MIDI track is selected.
 2. Start playback.
 3. If you use realtime MIDI, play a few notes on your keyboard.
-

RESULT

The MIDI notes trigger the Gate. The plug-in gates the audio signals.

RELATED LINKS

[Setting Up MidiGate](#) on page 79

Squasher

Squasher is a multi-band compressor that combines upward and downward compression, allowing you to squash the audio signal. You can set up different parameters for up to three frequency bands and use internal or external side-chaining sources to control the amount of compression for each band.

Main section

This section provides general settings for upward and downward compression for each frequency band.

Frequency/Compressor display

Displays the frequency spectrum. It allows you to edit the band range, the output level, the upward/downward ratio, and the upward/downward threshold for each band. You can switch the display between a frequency spectrum view and a compressor characteristics view by clicking the corresponding buttons left of the display:

Frequency spectrum

Compressor characteristics

You can edit the output level of a band or the cutoff frequency between two bands by dragging the corresponding handle in the frequency spectrum display.

Show/Hide Full Frequency Band View

Shows/Hides the frequency spectrum/compressor display.

Input meter

Shows the level of the overall input signal.

Input

Sets the overall input level.

Bands

Sets the number of frequency bands.

Mix

Adjusts the mix between dry signal and wet signal, preserving the transients of the input signal.

Parameter Link

Links the parameters of the same type in all bands. This allows you to edit parameter values of all bands in a module simultaneously. Two link modes are available:

- If **Absolute Mode** is activated and you edit a parameter value of one band, the corresponding parameter values of the other bands are set to the same value.
- If **Relative Mode** is activated and you edit a parameter value of one band, the relation of the corresponding parameter values of the other bands remains the same.

Activate/Deactivate Band

Activates/Deactivates the corresponding frequency band.

Solo Band

Solos the corresponding frequency band.

Up Ratio/Down Ratio

Set the amount of upward and downward compression. These parameters allow you to adjust the squashing effect.

In

Shows the input level for the corresponding frequency band.

Up Threshold/Down Threshold

The left triangle sets the threshold for upward compression. If the input signal is below this threshold, the upward compressor raises the level according to the **Up Ratio** value.

The right triangle sets the threshold for downward compression. If the input signal is above this threshold, the downward compressor lowers the level according to the **Down Ratio** value.

You can drag the darker area between both handles to adjust **Up Threshold** and **Down Threshold** simultaneously.

Output meter

Shows the level of the overall output signal.

Output

Sets the overall output level.

Squash Parameter section

This section provides additional compression and filter settings for each frequency band.

Show/Hide Squash Parameter Section

Shows/Hides the squash parameter section.

Att.

Sets the compression attack time for both the upward and downward compressor.

Rel.

Sets the compression release time for both the upward and downward compressor.

Drive

Sets the amount of saturation. This parameter adds harmonics to the output signal.

Gate

Sets the threshold for the internal gating effect. Signal levels above this threshold trigger the gate to open. Signal levels below this threshold close the gate.

NOTE

You can control this parameter via side-chaining.

Mix

Adjusts the mix between dry signal and wet signal for the corresponding band.

Output

Sets the output level for the corresponding band.

NOTE

Alternatively, you can edit this parameter by dragging the corresponding handle in the frequency display.

Side-Chain section

This section provides settings for internal and external side-chaining for each frequency band. It is only available if the parameter section is shown.

Show/Hide Side-Chain Section

Shows/Hides the side-chaining section.

Activate/Deactivate Side-Chaining for Band

Activates/Deactivates side-chaining for the corresponding band.

Side-Chain Input

This pop-up menu allows you to select the side-chain input for the corresponding band.

- **Internal** uses the input signal of the track.
- **Side-Chain 1 - Side-Chain 3** allow you to use the side-chain inputs of the plug-in.

Side-Chain Filter Listen

Lets you monitor the side-chain signal and the applied filter.

Freq

Sets the frequency of the side-chain filter.

Q

Sets the Q factor of the side-chain filter.

Send to

This pop-up menu allows you to send the side-chain signal to the compressor section (**Squasher**) or to the internal gate.

Tube Compressor

This versatile compressor with integrated tube-simulation allows you to achieve smooth and warm compression effects. The VU meter shows the amount of gain reduction. **Tube Compressor** features an internal side-chain section that lets you filter the trigger signal.

VU Meter

Shows the amount of gain reduction.

In/Out Meters

Show the highest peaks of all available input and output channels.

Input

Determines the compression amount. The higher the input gain, the more compression is applied.

Drive (1.0 to 6.0 dB)

Controls the amount of tube saturation.

Output (-12 to 12 dB)

Sets the output gain.

Character

Keeps the bass tight and preserves its attacks by decreasing the tube saturation for lower frequencies, and adds brilliance by creating harmonics for higher frequencies.

Attack (0.1 to 100 ms)

Determines how fast the compressor responds. If the attack time is long, more of the initial part of the signal passes through unprocessed.

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gain returns to its original level. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Mix

Adjusts the mix between dry signal and wet signal, preserving the transients of the input signal.

Ratio

Toggles between a low and a high ratio value.

Side-Chain

Activates the internal side-chain filter. The input signal can then be shaped according to the filter parameters. Internal side-chaining is useful for tailoring how the gate operates.

Side-chain section

Filter Type (Low-Pass/Band-Pass/High-Pass)

If **Side-Chain** is activated, these buttons allow you to set the filter type to low-pass, band-pass, or high-pass.

Center

If **Side-Chain** is activated, this sets the center frequency of the filter.

Q-Factor

If **Side-Chain** is activated, this sets the resonance or width of the filter.

Monitor

Allows you to monitor the filtered signal.

NOTE

This plug-in supports external side-chaining. For a description of how to set up side-chain routing, see the **Operation Manual**.

VintageCompressor

VintageCompressor is modeled after vintage type compressors.

This compressor features separate controls for **Input** and **Output** gain, **Attack**, and **Release**. In addition, there is a **Punch** mode which preserves the attack phase of the signal and a program-dependent **Auto Release** function.

VU Meter

Shows the amount of gain reduction.

In/Out Meters

Show the highest peaks of all available input and output channels.

Input

Determines the compression amount. The higher the input gain, the more compression is applied.

Attack (0.1 to 100 ms)

Determines how fast the compressor responds. If the attack time is long, more of the initial part of the signal passes through unprocessed.

Punch

If this is activated, the early attack phase of the signal is preserved, retaining the original punch in the audio material, even with short **Attack** settings.

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gain returns to its original level. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Mix

Adjusts the mix between dry signal and wet signal, preserving the transients of the input signal.

Output (-48 to 24 dB)

Sets the output gain.

NOTE

This plug-in supports external side-chaining. For a description of how to set up side-chain routing, see the **Operation Manual**.

VSTDynamics

VSTDynamics is an advanced dynamics processor. It combines three separate effects: **Gate**, **Compressor**, and **Limiter**, covering a variety of dynamic processing functions.

The window is divided into three sections containing controls and meters for each effect. Activate the individual effects using the **Gate**, **Compressor**, and **Limiter** buttons. You can select between three different routing options using the **Module Configurator** button.

Gate

Gating, or noise gating, is a method of dynamic processing that silences audio signals below a set threshold. As soon as the signal level exceeds the threshold, the gate opens to let the signal through. The gate trigger input can also be filtered using an internal side-chain signal.

The following parameters are available:

Input meter

Shows the level of the input signal.

Attack (0.1 to 100 ms)

Determines how fast the compressor responds to signals above the set threshold. If the attack time is long, more of the early part of the signal passes through unprocessed.

Threshold

Determines the level at which the gate is activated. Signal levels above the set threshold trigger the gate to open, and signal levels below the set threshold close the gate.

State LED

Indicates whether the gate is open (LED lights up in green), closed (LED lights up in red), or in an intermediate state (LED lights up in yellow).

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gate closes after the set **Hold** time. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Hold (0 to 2000 ms)

Determines how long the gate remains open after the signal drops below the threshold level.

Range

Adjusts the attenuation of the gate when it is shut. If **Range** is set to minus infinite , the gate is completely shut. The higher the value, the higher the level of the signal that passes through the shut gate.

Side-Chain

Activates the internal side-chain filter. The input signal can then be shaped according to the filter parameters. Internal side-chaining is useful for tailoring how the gate operates.

Filter Type (Low-Pass/Band-Pass/High-Pass)

If **Side-Chain** is activated, these buttons allow you to set the filter type to low-pass, band-pass, or high-pass.

Center

If **Side-Chain** is activated, this sets the center frequency of the filter.

Q-Factor

If **Side-Chain** is activated, this sets the resonance or width of the filter.

Monitor

Allows you to monitor the filtered signal.

Compressor

Compressor reduces the dynamic range of the audio, making softer sounds louder or louder sounds softer, or both. It features a separate display that graphically illustrates the compressor curve shaped according to your settings.

Input meter

Shows the level of the input signal.

Graphical display

Visualizes the settings for **Threshold** and **Ratio** and allows you to adjust them by dragging the handles.

Gain Reduction meter

Shows the amount of gain reduction.

Threshold (-60 to 0 dB)

Determines the level where the compressor kicks in. Only signal levels above the set threshold are processed.

Ratio

Sets the amount of gain reduction applied to signals above the set threshold. A ratio of 3:1 means that for every 3 dB the input level increases, the output level increases by 1 dB.

Make-Up (0 to 24 dB or Auto mode)

Compensates for output gain loss caused by compression. If **Auto Make-Up Gain** is activated, the output is automatically adjusted for gain loss.

Attack (0.1 to 100 ms)

Determines how fast the compressor responds to signals above the set threshold. If the attack time is long, more of the early part of the signal (attack) passes through unprocessed.

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gain returns to its original level when the signal drops below the threshold. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Limiter

A limiter ensures that the output level never exceeds a set threshold to avoid clipping in effects following in the chain. Conventional limiters usually require a very accurate setup of the attack and release parameters to prevent the output level from going beyond the set threshold level. **Limiter** adjusts and optimizes these parameters automatically according to the audio material.

Input meter

Shows the level of the input signal.

Gain Reduction meter

Shows the amount of gain reduction.

Soft Clip

If this button is activated, the signal is limited when the signal level exceeds -6 dB. At the same time, harmonics are generated, adding a warm, tube-like characteristic to the audio material.

Output

Sets the maximum output level.

Release (10 to 1000 ms or Auto mode)

Sets the time after which the gain returns to its original level. If **Auto Release** is activated, the plug-in automatically finds the best release setting for the audio material.

Output section

Output meter

Shows the level of the output signal.

Module Configurator

Changes the signal flow through the three effects. Changing the order of the effects can produce different results, and the available routing configurations allow you to quickly compare what works best for a given situation. Click **Module Configurator** to toggle between the following routing configurations:

- G-C-L (Gate-Compressor-Limiter)
- C-L-G (Compressor-Limiter-Gate)
- C-G-L (Compressor-Gate-Limiter)

EQ Plug-ins

DJ-EQ

DJ-EQ is an easy-to-use 3-band parametric equalizer that resembles the EQs found on typical DJ mixers. This plug-in is designed for quick sound fixes.

Graphical display

Allows you to set the amount of boost or attenuation for the low, mid, or high band by dragging.

- To set the low, mid, and high frequency gain, click and drag the corresponding band handle.
- To fine-adjust the gain, press **Shift** and drag.
- To set a parameter to zero, press **Ctrl/Cmd** and click it.

Low Frequency Gain/Mid Frequency Gain/High Frequency Gain

Set the amount of boost or attenuation for the low, mid, and high band.

Cut Low Frequencies/Cut Mid Frequencies/Cut High Frequencies

Cut the low, mid, and high band.

Output meter

Shows the level of the output signal.

GEQ-10

This is a graphic equalizer that provides 10 frequency bands.

GEQ-10

Each band can be attenuated or boosted by up to 12 dB, allowing for fine control of the frequency response. In addition, there are several preset modes available that can add color to the sound of **GEQ-10**.

You can draw response curves in the main display by clicking and dragging with the mouse. You have to click one of the sliders before you drag across the display.

At the bottom of the window, the individual frequency bands are shown in Hz. At the top of the display, the amount of attenuation/boost is shown in dB.

Output

Sets the overall gain of the equalizer.

Flatten

Resets all the frequency bands to 0 dB.

Range

Allows you to adjust how much a set curve cuts or boosts the signal.

Invert

Inverts the current response curve.

Mode pop-up menu

Allows you to set the filter mode that determines how the various frequency band controls interact to create the response curve.

EQ Modes

The **Mode** pop-up menu in the lower right corner allows you to select an EQ mode, which add color or character to the equalized output in various ways.

True Response

Applies serial filters with an accurate frequency response.

Digital Standard

In this mode, the resonance of the last band depends on the sample rate.

Classic

Applies a classic parallel filter structure where the response does not follow the set gain values accurately.

VariableQ

Applies parallel filters where the resonance depends on the amount of gain.

ConstQ asym

Applies parallel filters where the resonance is raised when boosting the gain and vice versa.

ConstQ sym

Applies parallel filters where the resonance of the first and last bands depends on the sample rate.

Resonant

Applies serial filters where a gain increase of one band lowers the gain in adjacent bands.

StudioEQ

Studio EQ is a high-quality 4-band parametric stereo equalizer. All four bands can act as fully parametric peak filters. In addition, the low and high bands can act as either shelving filters (three types) or as cut filters (low-pass/high-pass).

Main Layout

Reset

Alt/Opt-click this button to reset all parameter values.

Show Input/Output Spectrum

Shows the spectrum before and after filtering.

Output

Adjusts the overall output level.

Auto Gain

If this button is activated, the gain is automatically adjusted, keeping the output level nearly constant regardless of the EQ settings.

Band Settings

Activate/Deactivate Band

Activates/Deactivates the corresponding band.

NOTE

- If a band is deactivated, you can still modify its parameters.

Freq

Sets the frequency of the corresponding band. You can set the frequency either in Hz or as a note value. If you enter a note value, the frequency is automatically changed to Hz. For example, a note value of A3 sets the frequency to 440 Hz. When you enter a note value, you can also enter a cent offset. For example, enter A5 -23 or C4 +49.

NOTE

- You can adjust the **Freq** parameter of a band in the graphical editor by **Alt**-clicking the corresponding handle and moving the mouse left and right.
- Ensure that you enter a space between the note and the cent offset. Only in this case, the cent offsets are taken into account.

Inv

Inverts the gain value of the filter. Use this button to filter out unwanted noise. When looking for the frequency to omit, it sometimes helps to boost it in the first place (set the filter to positive gain). After you have found the frequency of the noise, you can use the **Inv** button to cancel it out.

Q

For **Peak** filters, this parameter controls the width of the band. For **Shelf** filters, it adds a drop or a boost, depending on the gain setting of the band. For **Cut** filters, it adds a resonance.

NOTE

- You can adjust the **Q** parameter of a band in the graphical editor by **Shift**-clicking the corresponding handle and moving the mouse up and down. Alternatively, you can point on the handle and turn the mouse wheel.

Gain

Sets the amount of attenuation/boost for the corresponding band.

NOTE

- You can adjust the **Gain** parameter of a band in the graphical editor by **Ctrl/Cmd**-clicking the corresponding handle and moving the mouse up and down.
- This parameter is not available for **Cut** filters.

Filter type

For the low and high band, you can choose between three types of shelving filters, a peak filter (band-pass), and a cut filter (low-pass/high-pass). If **Cut** mode is selected, the **Gain** parameter is fixed.

- **Shelf I** adds resonance in the opposite gain direction slightly above the set frequency.
- **Shelf II** adds resonance in the gain direction at the set frequency.
- **Shelf III** is a combination of **Shelf I** and **II**.

Filter Plug-ins

DualFilter

DualFilter filters out specific frequencies while allowing others to pass through.

Position

Sets the filter cutoff frequency. If you set this to a negative value, **DualFilter** acts as a low-pass filter. Positive values cause **DualFilter** to act as a high-pass filter.

Resonance

Sets the sound characteristic of the filter. With higher values, a ringing sound is heard.

MorphFilter

MorphFilter lets you mix low-pass, high-pass, band-pass, and band-reduction filter effects, allowing for creative morphings or mixtures between two filters.

Filter A buttons

Allow you to select the characteristic of the first filter.

- **Low Pass**
Eliminates high-frequency signal components. Filter slopes of 6, 12, 18, and 24 dB per decade are available.
- **Band Pass**
Allows signals falling within a certain frequency range to pass through. Filter slopes of 12 and 24 dB per decade are available.

Filter B buttons

Allow you to select the characteristic of the second filter.

- **High Pass**
Eliminates low-frequency signal components. Filter slopes of 6, 12, 18, and 24 dB per decade are available.
- **Band Rejection**
Lets all frequencies pass, except those in the stop band. Filter slopes of 12 and 24 dB per decade are available.

Resonance Factor

Sets the resonance value of both filters simultaneously.

Frequency

Sets the cutoff frequency of both filters simultaneously.

Graphical display

Visualizes the settings for all parameters. The handle allows you to adjust the **Morph Factor** and the **Frequency** parameters simultaneously.

Output meter

Shows the level of the output signal.

Morph Factor

Allows you to mix the output between both filters.

StepFilter

StepFilter is a pattern-controlled multimode filter that can create rhythmic, pulsating filter effects. You can also trigger pattern steps individually via MIDI.

General Operation

StepFilter can produce two simultaneous 16-step patterns for the filter cutoff and resonance parameters, synchronized to the sequencer tempo.

The horizontal axis shows the pattern steps 1 to 16 from left to right, and the vertical axis determines the (relative) filter cutoff frequency and resonance settings. The higher up on the vertical axis a step value is entered, the higher the relative filter cutoff frequency or filter resonance setting.

By starting playback and editing the patterns for the cutoff and resonance parameters, you can hear how your filter patterns affect the sound source connected to **StepFilter**.

If **Sync** is deactivated, **StepFilter** allows you to trigger pattern steps individually via MIDI notes.

Setting Step Values

- To enter a step, click in the pattern grid windows.
- Individual step entries can be dragged up or down the vertical axis, or directly set by clicking in an empty grid box. By click-dragging left or right, consecutive step entries are set at the pointer position.
- Change the value for a step by dragging it up or down.
- Draw in a curve by clicking and dragging in the display.

Selecting New Patterns

- Patterns are saved with the project, and up to 8 different cutoff and resonance patterns can be saved internally. Both the cutoff and resonance settings are saved together in the 8 pattern slots.
- Use the **Pattern** slots to select a new pattern. New patterns are all set to the same step value by default.

StepFilter Parameters

Filter Type

Sets the filter type. A low-pass, a band-pass, and a high-pass filter are available.

Filter Mode

Allows you to choose between two filter modes. **Classic** mode is compatible with previous versions of this plug-in. **Modern** mode provides an additional **Hard Clip** parameter.

Mix

Sets the level balance between dry and wet signal.

Base Cutoff

Sets the base filter cutoff frequency. Values set in the **Cutoff** grid are relative to the **Base Cutoff** value.

The **RND** control above the **Cutoff** grid allows you to apply a random deviation from the set **Base Cutoff** value with each new cycle of the pattern. The higher the **RND** value, the higher the allowed deviation.

Base Resonance

Sets the base filter resonance. Values set in the **Resonance** grid are relative to the **Base Resonance** value.

The **RND** control above the **Resonance** grid allows you to apply a random deviation from the set **Base Resonance** value with each new cycle of the pattern. The higher the **RND** value, the higher the allowed deviation.

NOTE

Very high **Base Resonance** settings can produce loud ringing effects at certain frequencies.

Rate

If **Sync** is activated, **Rate** allows you to specify the base note value for synchronizing the pattern playback to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If **Sync** is deactivated, you can trigger pattern steps individually via MIDI.

Hard Clip

Adds more high frequency harmonics and distortion to the signal. This parameter is only available in **Modern** mode.

Glide

Applies glide between the pattern steps, causing values to change more smoothly.

Output

Sets the output level.

RELATED LINKS

[Creating Variations for StepFilter Patterns](#) on page 96

[Controlling StepFilter via MIDI](#) on page 96

Creating Variations for StepFilter Patterns

You can copy a pattern of the **StepFilter** to another pattern slot. This is useful for creating variations on a pattern of this plug-in.

PROCEDURE

1. Select the pattern that you want to copy.
2. Click the **Copy** button.
3. Select another pattern slot.
4. Click the **Paste** button.

RESULT

The pattern is copied to the new slot and can now be edited to create variations.

Controlling StepFilter via MIDI

StepFilter allows you to trigger steps individually via MIDI notes.

PREREQUISITE

- Your project contains a MIDI track that is routed to the MIDI input of a track that uses **StepFilter** as an insert plug-in.
- In **StepFilter**, **Sync** is deactivated.

PROCEDURE

- Do one of the following:
 - Use the note C0 to increase the step number by one.
 - Use the notes from C1 to D#2 to trigger the steps 1 to 16 directly.

ToneBooster

ToneBooster is a filter that allows you to raise the gain in a selected frequency range. It is particularly useful if it is inserted before **AmpSimulator** in the plug-in chain, greatly enhancing the tonal varieties available.

Gain

Adjusts the gain of the selected frequency range by up to 24 dB.

Tone

Sets the center filter frequency.

Width

Sets the resonance of the filter.

Mode selector

Sets the basic operational mode of the filter: **Peak** or **Band** Mode.

RELATED LINKS

[AmpSimulator](#) on page 44

WahWah

WahWah is a variable slope band-pass filter that can be auto-controlled by a side-chain signal or via MIDI modeling the well-known analog pedal effect.

You can independently specify the frequency, width, and gain for the **Low** and **High** Pedal positions. The crossover point between the Lo and Hi Pedal positions lies at 50.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the **Pedal** parameter from another signal source. The louder the signal, the more the filter frequency is raised so that the plug-in acts as an auto-wah effect. For a description of how to set up side-chain routing, see the **Operation Manual**.

WahWah Parameters

Pedal

Controls the filter frequency sweep.

Pedal Control (MIDI)

Allows you to choose the MIDI controller that controls the plug-in. Set this to **Automation** if you do not want to use MIDI realtime control.

Freq Low/Freq High

Set the frequency of the filter for the Lo and Hi pedal positions.

Width Low/Width High

Set the width (resonance) of the filter for the Lo and Hi pedal positions.

Gain Low/Gain High

Set the gain of the filter for the Lo and Hi pedal positions.

Filter Slope selector

Allows you to choose between two filter slope values: 6 dB or 12 dB.

MIDI Control

For realtime MIDI control of the **Pedal** parameter, MIDI must be directed to the **WahWah** plug-in.

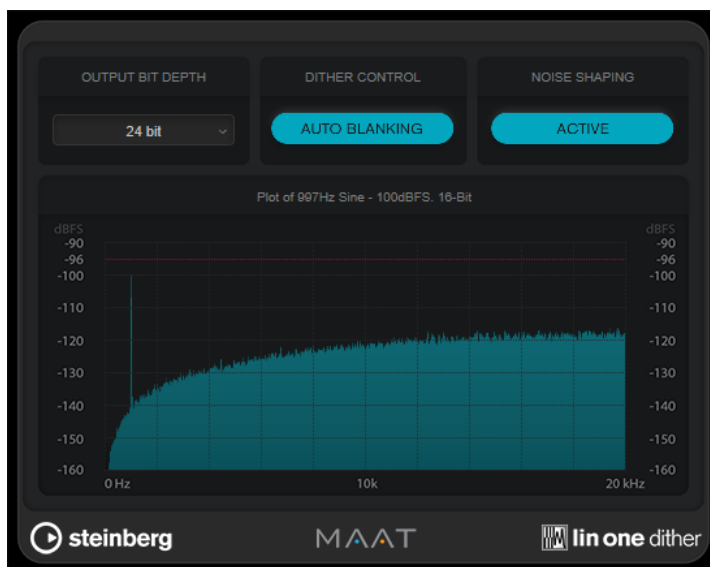

If **WahWah** is used as an insert effect (for an audio track or an FX channel), it is available on the **Output Routing** pop-up menu for MIDI tracks.

If **WahWah** is selected on the **Output Routing** menu, MIDI data is directed to the plug-in from the selected track.

Mastering Plug-ins

Lin One Dither

Lin One Dither is a dithering plug-in that uses advanced algorithms and offers additional noise shaping to increase the apparent signal-to-noise ratio by altering the spectrum of the low-level audio signal.

NOTE

We recommend applying dithering post-fader on output busses.

Output Bit Depth

Sets the bit depth of the output signal.

NOTE

Dithering changes the bit depth, but not the sample size. For example, when dithering 24 bit to 16 bit, the file is still 24 bit in size, although only 16 bits of information have significance. When processing a 16-bit file, specify the **Output Bit Depth** value accordingly to avoid the creation of unnecessarily large files.

Dither Control

If **Auto Blanking** is activated, the dither noise is gated during silent passages.

Noise Shaping

Activates/Deactivates noise shaping. Noise shaping increases the apparent signal-to-noise ratio.

Modulation Plug-ins

AutoPan

This auto-pan effect provides several parameters to modulate the left/right stereo position. You can use presets or create individual curves for the modulation waveform. **AutoPan** also allows for chopping effects by linking the modulation of left and right channel.

NOTE

The panning effect of this plug-in works only on stereo tracks.

Waveform display

Shows the shape of the modulation waveform and allows you to manually adjust it. To draw an individual curve, click a node and move the mouse. To draw a straight line, **Shift**-click a node and move the mouse.

Waveform preset buttons

Allow you to select presets for the modulation waveform.

- **Sine** creates a smooth sweep.
- **Triangle** creates a ramp, that is, a linear movement from full right to full left and back.
- **Square** creates an instant jump to full right, then to full left, and then back to center.

- **Random One Shot** creates a random curve. Click this button again to create a new random curve.
- **Random Continuous** automatically creates a new random curve after each period.

Phase

Sets the offset for the starting point of the curve. If multiple **AutoPan** plug-ins are used on different tracks, for example, different offset settings for each track allow for a more organic overall sound.

Factor

If **Sync** is activated, this parameter multiplies the sync rate by the selected factor. This allows you to create very slow movements in panorama.

Rate

Sets the auto-pan speed and shows the movement within the panorama. If **Sync** is deactivated, the speed is set in Hertz. If **Sync** is activated, you can set the speed in tempo values.

Sync

Activates/Deactivates tempo sync.

Link

If this button is activated, the left and right channel are modulated simultaneously. This results in a chopping effect instead of auto-panning.

In this mode, **Width** sets the intensity of the volume modulation.

Width

Sets the amount of deflection to the left and right side of the stereo panorama. If **Link** is activated, this parameter sets the intensity of the volume modulation.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the **Width** parameter from another signal source. For a description of how to set up side-chain routing, see the **Operation Manual**.

Smooth

Allows you to smooth the transition between individual steps of the panorama curve.

Chopper

Chopper allows you to create a tremolo with or without an additional panning effect.

Waveform buttons

Allow you to select the modulation waveform.

Depth

Sets the intensity of the effect. This can also be set by clicking and dragging in the graphical display.

Sync

Activates/Deactivates tempo sync.

Speed

If tempo sync is activated, this is where you specify the base note value for tempo-syncing the effect (1/1 to 1/32, straight, triplet, or dotted).

If tempo sync is deactivated, the tremolo speed can be set freely with the **Speed** control.

Mono

If this option is activated, **Chopper** acts as a tremolo effect only. If this option is deactivated, the modulation waveforms of the left and the right channel are phase-shifted, creating an additional panning effect.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Chorus

This plug-in is a single-stage chorus effect. It doubles the audio that is sent into it with a slightly detuned version.

Delay

Affects the frequency range of the modulation sweep by adjusting the initial delay time.

Width

Sets the depth of the chorus effect. Higher settings produce a more pronounced effect.

Spatial

Sets the stereo width of the effect. Turn clockwise for a wider stereo effect.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for synchronizing the modulation sweep to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the sweep rate can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Waveform Shape

Allows you to select the modulation waveform, altering the character of the chorus sweep. A sine and a triangle waveform are available.

Lo Filter/Hi Filter

Allow you to roll off low and high frequencies of the effect signal.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the modulation from another signal source. If the side-chain signal exceeds the threshold, the modulation is controlled by the side-chain signal's envelope. For a description of how to set up side-chain routing, see the **Operation Manual**.

Flanger

This is a classic flanger effect with added stereo enhancement.

Delay

Affects the frequency range of the modulation sweep by adjusting the initial delay time.

Feedback

Determines the character of the flanger effect. Higher settings produce a more metallic-sounding sweep.

Mode

Allows you to toggle between **LFO** and **Manual** mode.

In **LFO** mode, you can define the sweep rate or sync it to the project tempo. In **Manual** mode, you can change the sweep manually.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for synchronizing the flanger sweep to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the sweep rate can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Spatial

Sets the stereo width of the effect. Turn clockwise for a wider stereo effect.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Lo Range/Hi Range

Set the frequency boundaries for the flanger sweep.

Waveform Shape

Allows you to select the modulation waveform, altering the character of the flanger sweep. A sine and a triangle waveform are available.

Lo Filter/Hi Filter

Allow you to roll off low and high frequencies of the effect signal.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the modulation from another signal source. If the side-chain signal exceeds the threshold, the modulation is controlled by the side-chain signal's envelope. For a description of how to set up side-chain routing, see the **Operation Manual**.

FX Modulator

This multi-effect modulation plug-in combines several modulation effects that allow for extensive sound shaping, from classic ducking effects to exciting rhythmic patterns. You can create custom-shaped LFOs and modulate up to 6 integrated effect modules at once. The LFO can be triggered via MIDI or separate side-chain inputs, where the envelope of the side-chain signal is added to the LFO.

Curve Section

This section contains a curve editor that allows you to define the modulation curve. You can apply predefined curve shapes, or create and store custom curve shapes.

Factory

The factory bank allows you to apply predefined curve shapes to the whole curve or a selection range. You cannot change the assignment of the factory slots. However, you can adjust factory curves in the editor after applying it.

Bank 1-3

User banks allow you to apply custom curve shapes to the whole curve or a selection range.

- To add the curve shape that is displayed in the editor to a user bank, click an empty slot.
- To remove the curve shape of a slot, click **x** and click again to confirm. To cancel, click elsewhere.

Load opens a browser window that shows the available bank presets.

- To load a bank preset to the selected bank, double-click it.
- To filter the list of bank presets, click **Set Up Window Layout** at the top right of the browser window, activate **Filters**, and select your filter settings.

Save allows you to save the curve shapes in the selected bank as a bank preset.

Lock Banks 1-3 When Loading Presets

Locks/Unlocks **Bank 1**, **Bank 2**, and **Bank 3** while browsing through presets.

Curve editor

Shows the shape of the modulation curve and allows you to manually adjust it. The editor allows the following editing techniques:

- To add a node, double-click the curve.
- To move a node, drag it. If you move a node close to a horizontal or vertical grid line, it automatically snaps to the grid. To suspend this behavior, hold **Shift** while dragging.
- To delete a node or shape handle, double-click it.
- To move, delete, or flip multiple nodes or shape handles, drag a selection rectangle around them and edit them.
- To modify the shape of the curve, drag the curve between two nodes.
- To create an S-shaped curve, hold **Shift** and drag the shape handle left of a node.
- To compress or expand the curve, hold **Alt** and drag a node of a selection up or down.

Threshold

Sets the threshold value for **1 Cycle** trigger mode. The threshold value is shown as a horizontal line within the display. This control is only available if **Side-Chain** is activated and **1 Cycle** mode is selected in the **Trigger** section.

Duplicate Curve

Duplicates the shape of the curve.

Undo/Redo

Undoes/Redoes actions in the curve editor.

NOTE

Each modulation curve has its own undo/redo history

Shift Curve to the Left

Moves the curve to the left.

Shift Curve to the Right

Moves the curve to the right

Flip Vertically

Flips the shape of the whole curve or a selection range vertically.

Flip Horizontally

Flips the shape of the whole curve or a selection range horizontally.

Select All Curve Points

Selects all curve nodes and handles.

Reset Curve

Resets the curve to default.

Create Random Curve

Applies a random shape to the whole curve or a selection range.

Show Curve Editing Instructions

Shows/Hides a list of techniques for editing the modulation curve in the editor.

Main Section

This section contains the general modulation parameters and settings.

Time

Sets the time base for the modulation curve individually for each modulated effect parameter. The default value of 1/1 means that 1 cycle of modulation has a length of 1 bar. The tempo of the song is automatically taken into account.

If **Beats** is activated, **Time** is displayed in beats instead of milliseconds.

If **Phase Sync** is activated, the modulation curve is synchronized to the song position in the project, making the modulation highly reproducible. If **Phase Sync** is deactivated, **Time** allows a free modulation, making effects like chorus and flanger sound unpredictable.

Smooth

Smooths sharp edges and steep slopes of the modulation curve individually for each modulated effect parameter. This can avoid artifacts that are caused by abrupt value changes.

Mix

Sets the level balance between dry and wet signal.

Lock Mix Value When Loading Presets

Locks/Unlocks the balance between dry and wet signal when loading presets.

Output

Sets the output level.

Effects Section

This section allows you to add, edit, and remove effects. You can create effect chains by adding up to 6 different effect modules from 14 effects available overall. You can modify the order of the effects in the chain by dragging the modules.

For each effect, you can see which is its target parameter that is affected by the modulation curve. Some effects have multiple target parameters. A filter bank allows you to restrict the modulation to a defined frequency range.

Effects

Shows/Hides the effect parameters and filter bank settings.

Target

Shows the parameter that is modulated by the modulation curve. For effects with multiple target parameters, click a parameter to show and edit its specific modulation curve.

Filter Bank

Activates/Deactivates the filter bank for the selected module. If activated, the effect is restricted to the range defined on the frequency display. Frequencies below and above this range are bypassed.

Spectrum

Activates/Deactivates the spectrum display for the effect signal on the frequency display.

NOTE

Activating this option increases the CPU load.

Solo

Allows you to listen to the set frequency range exclusively. Frequencies below and above this range are muted.

Frequency display

Shows the spectrum of the effect signal and allows you to define the frequency range of the filter bank. To adjust the range, drag the frequency handles or drag the area between the handles.

Trigger Section

This section allows you to determine how the modulation curves are applied when triggered via MIDI or side-chaining.

The following settings are available for MIDI triggering:

Trigger

Shows/Hides the settings for MIDI and side-chain triggering.

MIDI

Activates/Deactivates triggering via MIDI.

Mode

Sets the mode for MIDI triggering.

- If **Hold** is selected, the modulation curve is applied as long as a MIDI note is played.
- If **1 Cycle** is selected and a MIDI note is played, the modulation curve is only applied once, regardless of the note length. You must play a note again to apply the curve again.

NOTE

This mode is useful to create MIDI-triggered ducking effects with the **Volume** or **Compressor** effect modules.

The following settings are available for side-chain triggering:

Side-Chain

Activates/Deactivates triggering via side-chain input.

Mode

Sets the mode for side-chain triggering

- If **Continuous** is selected, the envelope of the side-chain signal is added to the modulation curve.
- If **1 Cycle** is selected and the envelope of the side-chain signal exceeds the threshold, the modulation curve is applied once.

NOTE

- This mode is useful to create envelope-triggered ducking effects with the **Volume** or **Compressor** effect modules.
 - If this mode is selected, the envelope of the side-chain signal and the threshold are shown in the curve editor, and you can set the **Threshold** there.
-

Input

Sets the side-chain input. If **Internal** is selected, the input signal of the plug-in is used as the side-chain source. If **Side-Chain 1** to **Side-Chain 6** is selected, the signal of tracks that are routed to the corresponding plug-in side-chain input is used.

Side-Chain Filter Listen

Allows you to solo the side-chain filter. This way, you can quickly check the part of the signal that is filtered out using the current settings.

Frequency

Sets the frequency of the side-chain filter.

You can set the frequency either in Hz or as a note value. If you enter a note value, the frequency is automatically changed to Hz. For example, a note value of A3 sets the frequency to 440 Hz. When you enter a note value, you can also enter a cent offset. For example, enter A5 -23 or C4 +49.

NOTE

- Ensure that you enter a space between the note and the cent offset. Only then are cent offsets taken into account.
-

Q

Sets the resonance or width of the side-chain filter.

Attack

Sets the attack time for the side-chain envelope signal.

Release

Sets the release time for the side-chain envelope signal.

Gain

Attenuates or boosts the side-chain envelope signal.

RELATED LINKS

[Effect Modules](#) on page 109

Effect Modules

Modules allow you to create an effect chain. Each effect can be used only once in the module chain. You can drag modules in the module chain to rearrange them and change the processing order.

General Effect Settings

The following settings are available for each module:

Bypass

Bypasses the module. This allows you to compare the sound of the unprocessed signal to that of the processed signal.

Solo

Solos the module. Only one module can be soloed at a time.

Remove

Removes the module from the module chain.

The following effect modules are available:

Chorus

This is a single-stage chorus effect that doubles the input signal with a slightly detuned version.

Target

Shows the parameter that is modulated. **Frequency** changes the modulation.

Mix

Sets the level balance between dry and wet signal.

Flanger

This is a classic flanger effect.

Target

Shows the parameter that is modulated. **Frequency** changes the modulation.

Feedback

Determines the character of the flanger effect. Higher settings produce a more metallic-sounding sweep.

Mix

Sets the level balance between dry and wet signal.

Filter

This is a filter modulation effect. The frequency and resonance of the filter can be modulated by an LFO.

Target

Selects a parameter for editing its modulation curve. **Frequency** changes the filter frequency. **Q** changes the resonance of the filter.

Filter Type

Sets the filter type. Low-pass, high-pass, band-pass, and notch filters are available.

Mix

Sets the level balance between dry and wet signal.

MultiMod

This is a three-stage chorus-flanger combined effect.

Target

Selects a stage for editing its modulation curve.

Feedback

Determines the character of the flanger effect. Higher settings produce a more metallic-sounding sweep.

Delay

Affects the frequency range of the modulation sweep by adjusting the initial delay time.

Mix

Sets the level balance between dry and wet signal.

Width

This effect expands or reduces the stereo width.

NOTE

This effect module only works if the plug-in is applied on a stereo track.

Target

Shows the parameter that is modulated. **Mix** changes the level balance between the dry signal and the wet signal.

Delay

Increases the amount of differences between the left and right channels to further increase the stereo effect.

Color

Generates additional differences between the channels to increase the stereo enhancement.

Mono In

Defines the input signal as dual-mono audio.

NOTE

For the stereo effect to work, you must activate this option if your input signal is a dual-mono audio file.

Listen Mono Out

Sets the output to mono. This allows you to check for unwanted coloring of the sound which can occur when creating an artificial stereo image.

Pan

This is a panning effect.

NOTE

This effect module only works if the plug-in is applied on a stereo track.

Target

Shows the parameter that is modulated. **Pan** changes the level balance between the left and right channel.

Pan Law

Sets the stereo pan law. **6 dB**, **4.5 dB**, **3 dB**, and **0 dB** determine the attenuation of the signal at the center position. **Equal Power** means that the power of the signal remains the same regardless of the pan setting.

Bit Crusher

This effect uses bit reduction to decimate and truncate the input audio signal to get a noisy, distorted sound.

Target

Selects a parameter for editing its modulation curve. **Mix** changes the level balance between the dry signal and the wet signal. **Sample Div.** changes the amount by which the audio samples are decimated. At the highest setting, nearly all of the information describing the original audio signal is eliminated, turning the signal into unrecognizable noise.

Bits (0 to 24 bits)

Defines the bit resolution. A setting of 24 gives the highest audio quality, while a setting of 1 creates mostly noise.

Mode

Allows you to select one of the four operating modes. In each mode, the effect sounds differently. Modes **1** and **3** are nastier and noisier, while modes **2** and **4** are more subtle.

Overdrive

This effect creates a tube-like overdrive effect.

Target

Shows the parameter that is modulated. **Drive** adds harmonics to the output signal.

Level

Adjusts the output level.

Mix

Sets the level balance between dry and wet signal.

Pitch Shifter

This is a pitch-shifting effect.

Target

Selects a parameter for editing its modulation curve. **Detune** changes the pitch of the input signal in semitones. **Formant** changes the natural timbre of the input signal.

Formant Preservation

Keeps the formants when changing the pitch with the **Detune** control.

Mix

Sets the level balance between dry and wet signal.

Frequency Shifter

This effect shifts each frequency of the input signal by a fixed amount, which alters the harmonic relations. Adding feedback produces a sound similar to a phaser.

Target

Selects a parameter for editing its modulation curve. **Shift** changes the amount of frequency shift. **Feedback** changes the amount of the signal that is sent from the output of the effect back to its input.

Mix

Sets the level balance between dry and wet signal.

Compressor

Target

Shows the parameter that is modulated. **Trig. Level XXX**

Threshold (-60 to 0 dB)

Determines the level where the compressor kicks in. Only signal levels above the set threshold are processed.

Ratio

Sets the amount of gain reduction applied to signals above the set threshold. A ratio of 3:1 means that for every 3 dB the input level increases, the output level increases by 1 dB.

Attack (0.1 to 100 ms)

Determines how fast the compressor responds to signals above the set threshold. If the attack time is long, more of the early part of the signal passes through unprocessed.

Release (10 to 1000 ms)

Sets the time after which the gain returns to its original level when the signal drops below the threshold.

Make-Up (0 to 24 dB or Auto mode)

Compensates for output gain loss caused by compression.

Volume

Target

Shows the parameter that is modulated. **Level** changes the output level.

Mix

Sets the level balance between dry and wet signal.

Time Shifter

Target

Shows the parameter that is modulated. **Delay** changes the delay time.

Mix

Sets the level balance between dry and wet signal.

Reverb

This is a versatile reverb for realistic room ambience and reverb effects.

Target

Shows the parameter that is modulated. **Mix** changes the level balance between the dry signal and the wet signal.

Pre-Delay

Determines how much time passes before the reverb is applied. This allows you to simulate larger rooms by increasing the time it takes for the first reflections to reach the listener.

Time

Allows you to set the reverb time in seconds.

Size

Alters the delay times of the early reflections to simulate larger or smaller spaces.

Metalizer

Metalizer feeds the audio signal through a variable frequency filter, with tempo sync or time modulation and feedback control.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

On/Off

Activates/Deactivates filter modulation. If it is deactivated, **Metalizer** works as a static filter.

Speed

If tempo sync is activated, this is where you specify the base note value for synchronizing the effect to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If tempo sync is deactivated, the modulation speed can be set freely with the **Speed** control.

Sync

Activates/Deactivates tempo sync.

Mono

Switches the output to mono.

Feedback

Determines the character of the metal effect. Higher settings produce a more metallic sound.

Sharpness

Sets the character of the filter effect. The higher the value, the narrower the affected frequency area, which produces a sharper sound and a more pronounced effect.

Tone

Sets the feedback frequency. The effect of this is more noticeable with high **Feedback** settings.

Output

Sets the output level.

Phaser

Phaser produces the well-known swooshing phasing effect with additional stereo enhancement.

Feedback

Determines the character of the phaser effect. Higher settings produce a more pronounced effect.

Width

Sets the intensity of the modulation effect between higher and lower frequencies.

Mode

Allows you to toggle between **LFO** and **Manual** mode.

In **LFO** mode, you can define the sweep rate or sync it to the project tempo. In **Manual** mode, you can change the sweep manually.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for tempo-syncing the phaser sweep (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the sweep rate can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Spatial

If you are using multi-channel audio, the **Spatial** parameter creates a 3-dimensional impression by delaying modulation in each channel.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Lo Filter/Hi Filter

Allow you to roll off low and high frequencies of the effect signal.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the modulation from another signal source. If the side-chain signal exceeds the threshold, the

modulation is controlled by the side-chain signal's envelope. For a description of how to set up side-chain routing, see the **Operation Manual**.

RingModulator

RingModulator can produce complex, bell-like enharmonic sounds.

Ring modulators work by multiplying two audio signals. The ring-modulated output contains added frequencies generated by the sum of, and the difference between, the frequencies of the two signals.

RingModulator has a built-in oscillator that is multiplied with the input signal to produce the effect.

Oscillator

Waveform buttons

Allow you to select the oscillator waveform: square, sine, saw, or triangle.

LFO Amount

Controls how much the LFO affects the oscillator frequency.

Env. Amount

Controls how much the oscillator frequency is affected by the envelope that is triggered by the input signal. Left of center, a loud input signal decreases the oscillator pitch, whereas right of center the oscillator pitch increases if it is fed a loud input.

Frequency

Sets the oscillator frequency ± 2 octaves within the selected range.

Roll-Off

Attenuates high frequencies in the oscillator waveform to soften the overall sound. This is best used with harmonically rich waveforms, for example, square or saw.

Range

Determines the frequency range of the oscillator in Hz.

LFO

Waveform buttons

Allow you to select the LFO waveform: square, sine, saw, or triangle.

Speed

Sets the LFO speed.

Env. Amount

Controls how much the input signal level – via the envelope generator – affects the LFO speed. With negative values, a loud input signal slows down the LFO, whereas positive values speed it up at loud input signals.

Invert

Inverts the LFO waveform for the right channel of the oscillator, which produces a wider stereo effect for the modulation.

Envelope Generator

The envelope generator parameters control how the input signal is converted to envelope data, which can then be used to control oscillator pitch and LFO speed.

Attack

Controls how fast the envelope output level rises in response to a rising input signal.

Decay

Controls how fast the envelope output level falls in response to a falling input signal.

Lock R>L

If this button is activated, the L and R input signals are merged, and produce the same envelope output level for both oscillator channels. If the button is deactivated, each channel has its own envelope that affects the two channels of the oscillator independently.

Level Settings

Mix

Sets the level balance between dry and wet signal.

Output

Sets the output level.

Rotary

This modulation effect simulates the classic effect of a rotating speaker.

A rotary speaker cabinet features speakers rotating at variable speeds to produce a swirling chorus effect, commonly used with organs.

Speed settings

Speed Mod Control (MIDI)

This pop-up menu allows you to select the MIDI controller that controls the rotary speed. If you do not want to use MIDI realtime control, set this to **Automation**. If you select **PitchBend** as MIDI controller, the speed changes with an up or down flick of the bender. If other MIDI controllers are used, the speed changes at MIDI value 64.

Speed selector (stop/slow/fast)

Allows you to control the speed of the rotary speaker.

Speed Mod

If the **Set Speed Change Mode** setting is set to the right, this control allows you to modulate the rotary speed.

Set Speed Change Mode

If this is set to the left, the speed selector settings are taken into account. If this is set to the right, you can modulate the speed with the **Speed Mod** control and/or with a MIDI controller that you can select on the **Speed Mod Control (MIDI)** pop-up menu.

Additional settings

Overdrive

Applies a soft overdrive or distortion.

Crossover

Sets the crossover frequency (200 to 3000 Hz) between the low and high frequency loudspeakers.

Horn

Slow

Allows for a fine adjustment of the high rotor **slow** speed.

Fast

Allows for a fine adjustment of the high rotor **fast** speed.

Accel.

Allows for a fine adjustment of the high rotor acceleration time.

Amp Mod

Controls the high rotor amplitude modulation.

Freq Mod

Controls the high rotor frequency modulation.

Bass

Slow

Allows for a fine adjustment of the low rotor **slow** speed.

Fast

Allows for a fine adjustment of the low rotor **fast** speed.

Accel.

Allows for a fine adjustment of the low rotor acceleration time.

Amp Mod

Adjusts the modulation depth of the amplitude.

Level

Adjusts the overall bass level.

Mics

Phase

Adjusts the phasing amount in the sound of the high rotor.

Angle

Sets the simulated microphone angle. A value of 0 ° corresponds to a mono miking setup with a single microphone in front of the speaker cabinet, 180 ° corresponds to a stereo miking setup with a microphone on each side of the cabinet.

Distance

Sets the simulated microphone distance from the speaker in inches.

Final Settings

Output

Sets the output level.

Mix

Sets the level balance between dry and wet signal.

Directing MIDI to the Rotary

For realtime MIDI control of the **speed** parameter, MIDI must be directed to **Rotary**.

- If **Rotary** is used as insert effect (for an audio track or an FX channel), it is available on the **Output Routing** pop-up menu for MIDI tracks. If **Rotary** is selected on the **Output Routing** pop-up menu, MIDI is directed to the plug-in from the selected track.

Tranceformer

Tranceformer is a ring modulator effect that modulates incoming audio by an internal, variable frequency oscillator, producing new harmonics. You can use a second oscillator to modulate the frequency of the first oscillator, in sync with the song tempo if needed.

Mix

Sets the level balance between dry and wet signal.

Waveform buttons

Allow you to select a pitch modulation waveform.

Waveform display

Allows you to modify the **Pitch** and **Depth** parameters simultaneously by dragging.

Pitch

Sets the frequency of the modulating oscillator.

Activate/Deactivate Pitch Modulation

Activates/Deactivates the modulation of the pitch parameter.

Speed

If tempo sync is activated, this is where you specify the base note value for synchronizing the effect to the tempo of the host application (1/1 to 1/32, straight, triplet, or dotted).

If tempo sync is deactivated, the modulation speed can be set freely with the **Speed** control.

Sync

Activates/Deactivates tempo sync.

Depth

Sets the intensity of the pitch modulation.

Mono

Switches the output to mono.

Output

Sets the output level.

Tremolo

Tremolo produces amplitude modulation.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for tempo-syncing the effect (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the modulation speed can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Depth

Governs the depth of the amplitude modulation.

Spatial

Adds a stereo effect to the modulation.

Output

Sets the output level.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the modulation from another signal source. If the side-chain signal exceeds the threshold, the modulation is controlled by the side-chain signal's envelope. For a description of how to set up side-chain routing, see the **Operation Manual**.

Vibrato

Vibrato creates pitch modulation.

Depth

Sets the intensity of the pitch modulation.

Rate

If **Tempo Sync** is activated, **Rate** allows you to specify the base note value for tempo-syncing the effect (1/1 to 1/32, straight, triplet, or dotted).

If **Tempo Sync** is deactivated, the modulation speed can be set freely with the **Rate** dial.

Sync

Activates/Deactivates tempo sync.

Spatial

Adds a stereo effect to the modulation.

NOTE

This plug-in supports external side-chaining. You can use the side-chain input to control the modulation from another signal source. If the side-chain signal exceeds the threshold, the modulation is controlled by the side-chain signal's envelope. For a description of how to set up side-chain routing, see the **Operation Manual**.

Other Plug-ins

LoopMash FX

LoopMash FX is a live performance effect offering DJ effects that can be controlled by a MIDI keyboard.

Quantize Note

Sets the note value on which the quantize grid of the effects is based.

Performance Controls

By clicking these buttons during playback, you can apply effects to your overall performance.

An effect is applied as long as you keep the button pressed.

NOTE

The effects can be automated. The automation of effect parameters is described in the **Operation Manual**.

Backspin

Simulates a turntable backspin.

Reverse

Plays the slice in reverse.

Tapestart

Simulates a tapestart, that is, speeds the slice up.

Scratch

Plays the slice as if scratched.

Slowdown

Applies a slowdown.

Tapestop 1

Simulates a tapestop, that is, slows the slice down, first lightly then abruptly.

Tapestop 2

Simulates a tapestop, that is, slows the slice down, smoothly.

Stutter

Plays only the initial portion of a slice and repeats it 2, 3, 4, 6, or 8 times during one slice length.

Slur

Stretches the slice over 2 or 4 slice lengths.

Cycle

Sets up a short cycle over 4, 2, or 1 slice. This short cycle is always set up within the loop range that is set in the ruler. Setting up a cycle over 1 slice means that this slice is repeated until you release the button.

Staccato

Shortens the slice.

Mute

Mutes the slice.

Triggering the Performance Controls with Your MIDI Keyboard

You can trigger the performance controls with your MIDI keyboard starting from C3 upwards. You can also use the virtual keyboard for triggering the performance controls (for information about the virtual keyboard see the **Operation Manual**).

Controlling LoopMash FX with a MIDI Keyboard

PROCEDURE

1. Create an audio track and import an audio file, a drum loop, for example.
 2. Insert **LoopMash FX** as an insert effect.
 3. Play back the drum loop in a cycle.
 4. Create a MIDI track.
 5. On the **Output Routing** pop-up menu for the MIDI track, select **LoopMash FX**.
-

RESULT

You can trigger the different **LoopMash FX** performance effects with a MIDI keyboard.

Pitch Shift Plug-ins

Octaver

This plug-in can generate two additional voices that track the pitch of the input signal one octave and two octaves below the original pitch. **Octaver** is best used with monophonic signals.

Direct

Sets the level balance between the dry signal and the wet signal. A value of 0 means that only the generated and transposed signal is heard. By raising this value, more of the original signal is heard.

Octave 1

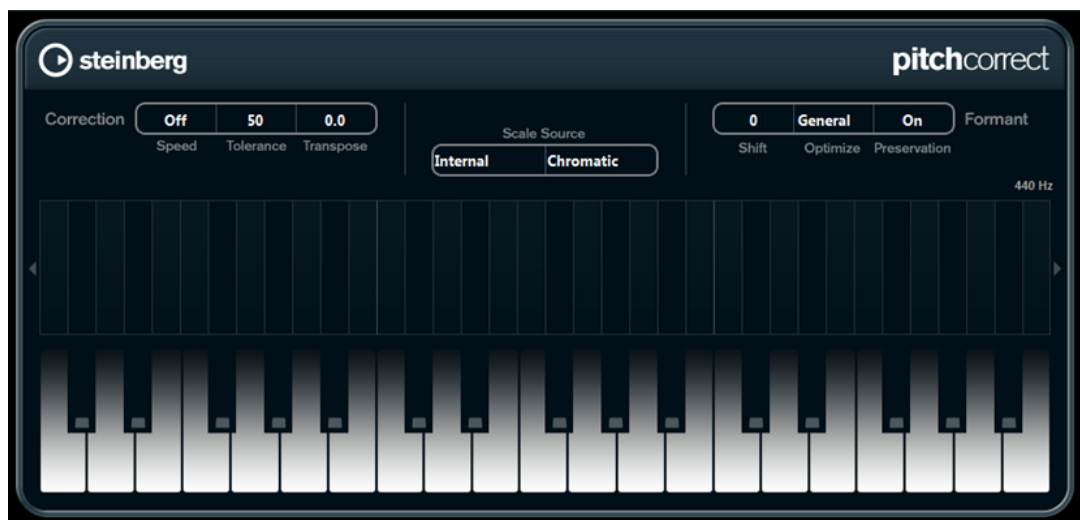

Adjusts the level of the generated signal one octave below the original pitch. A setting of 0 means that the voice is muted.

Octave 2

Adjusts the level of the generated signal two octaves below the original pitch. A setting of 0 means that the voice is muted.

Pitch Correct

Pitch Correct automatically detects, adjusts, and fixes slight pitch and intonation inconsistencies in monophonic vocal and instrumental performances in realtime. The advanced algorithms preserve the formants of the original sound and allow for natural sounding pitch correction without the typical Mickey Mouse effect.

You can use **Pitch Correct** creatively. You can create backing vocals, for example, by modifying the lead vocals or vocoder sounds by using extreme values. You can use an external MIDI controller, a MIDI track, or the virtual keyboard to play a note or a scale of target pitches that determine the current scale notes to which the audio is shifted. This allows you to change your audio in a very quick and easy way, which is extremely useful for live performances. In the keyboard display, the original audio is displayed in blue while the changes are displayed in orange.

Correction

Speed

Determines the smoothness of the pitch change. Higher values cause the pitch shift to occur immediately. 100 is a very drastic setting that is designed mainly for special effects.

Tolerance

Determines the sensitivity of analysis. A low Tolerance value lets Pitch Correct find pitch changes quickly. If the Tolerance value is high, pitch variations in the audio (for example, vibrato) are not immediately interpreted as note changes.

Transpose

With this parameter you can adjust, or retune, the pitch of the incoming audio in semitone steps. A value of zero means that the signal is not transposed.

Scale source

Internal

If you choose the **Internal** option from the **Scale Source** pop-up menu, you can use the pop-up menu next to it to decide to which scale the source audio is adapted.

- **Chromatic:** The audio is pitched to the closest semitone.
- **Major/Minor:** The audio is pitched to the major/minor scale specified on the pop-up menu to the right. This is reflected on the keyboard display.
- **Custom:** The audio is pitched to the notes that you specify by clicking keys on the keyboard display. To reset the keyboard, click the orange line below the display.

External MIDI Scale

Select this option if you want the audio to be shifted to a scale of target pitches, using an external MIDI controller, the virtual keyboard, or a MIDI track.

NOTE

You have to assign the audio track as the output of your MIDI track and the **Speed** parameter has to be set to a value other than **Off**.

External MIDI Note

Select this option if you want the audio to be shifted to a target note, using an external MIDI controller, the Virtual Keyboard or a MIDI track.

NOTE

You have to assign the audio track as the output of your MIDI track and the **Speed** parameter has to be set to a value other than **Off**.

Chord Track – Chords

Select this option if you want the audio to be shifted to target chords, using the chord information from the Chord track.

NOTE

You have to add a MIDI track in addition to the Chord track and assign **Pitch Correct** as output of the MIDI track.

Chord Track – Scale

Select this option if you want the audio to be shifted to a scale of target pitches, using the scale information from the Chord track.

NOTE

You have to add a MIDI track in addition to the Chord track and assign **Pitch Correct** as output of the MIDI track.

Formant

Shift

Changes the natural timbre, that is, the characteristic frequency components of the source audio.

Optimize (General, Male, Female)

Allows you to specify the sound characteristics of the sound sources. **General** is the default setting, **Male** is designed for low pitches and **Female** for high pitches.

Preservation

If this parameter is set to **Off**, formants are raised and lowered with the pitch, provoking strange vocal effects. Higher pitch correction values result in Mickey Mouse effects, lower pitch correction values in Monster sounds. If this parameter is set to **On**, the formants are kept, maintaining the character of the audio.

Master Tuning

Detunes the output signal.

Reverb Plug-ins

REvelation

REvelation produces a high-quality algorithmic reverb with early reflections and reverb tail.

The early reflections are responsible for the spatial impression in the first milliseconds of the reverb. For emulating different rooms, you can choose between different early reflections patterns and adjust their size. The reverb tail, or late reverberation, offers parameters for controlling the room size and the reverb time. You can adjust the reverb time individually in 3 frequency bands.

Pre-Delay

Determines how much time passes before the reverb is applied. This allows you to simulate larger rooms by increasing the time it takes for the first reflections to reach the listener.

Early Reflections

Here, you select an early reflections pattern. The early reflections pattern contains the most important delays that deliver the key information for the spatial impression of the room.

ER/Tail Mix

Sets the level balance between the early reflections and the reverb tail. At a setting of 50 %, early reflections and tail have the same volume. Settings below 50 % raise the early reflections and lower the tail, as a result the sound source moves towards the front of the room. Settings above 50 % raise the tail and lower the early reflections, as a result the sound source moves towards the back of the room.

Size

Adjusts the length of the early reflections pattern. At a setting of 100 %, the pattern is applied with its original length and the room sounds the most natural. At settings below 100 %, the early reflections pattern is compressed and the room is perceived smaller.

Low Cut

Attenuates the low frequencies of the early reflections. The higher this value, the less low frequencies are present in the early reflections.

High Cut

Attenuates the high frequencies of the early reflections. The lower this value, the less high frequencies the early reflections will have.

Delay

Delays the onset of the reverb tail.

Room Size

Controls the dimensions of the simulated room. At a setting of 100 %, the dimensions correspond to a cathedral or a large concert hall. At a setting of 50 %, the dimensions correspond to a medium-sized room or studio. Settings below 50 % simulate the dimensions of small rooms or a booth.

Main Time

Controls the overall reverb time of the tail. The higher this value, the longer the reverb tail will decay. At a setting of 100 %, the reverb time is infinitely long. The **Main Time** parameter also represents the mid band of the reverb tail.

High Time

Controls the reverb time for the high frequencies of the reverb tail. With positive values, the decay time of the high frequencies is longer. With negative values, it is shorter. Frequencies are affected depending on the **High Freq** parameter.

Low Time

Controls the reverb time for the low frequencies of the reverb tail. For positive values, low frequencies decay longer and vice versa. Frequencies will be affected depending on the **Low Freq** parameter.

High Freq

Sets the cross-over frequency between the mid and the high band of the reverb tail. You can offset the reverb time for frequencies above this value from the main reverb time with the **High Time** parameter.

Low Freq

Sets the cross-over frequency between the low and the mid band of the reverb tail. The reverb time for frequencies below this value can be offset from the main reverb time with the **Low Time** parameter.

Shape

Controls the attack of the reverb tail. At a setting of 0 %, the attack is more immediate, which is a good setting for drums. The higher this value, the less immediate the attack.

Density

Adjusts the echo density of the reverb tail. At a setting of 100 %, single reflections from walls cannot be heard. The lower this value, the more single reflections can be heard.

High Cut

Attenuates the high frequencies of the reverb tail. The lower this value, the less high frequencies the reverb tail will have.

Width

Controls the width of the stereo image. At a setting of 0 %, the output of the reverb is mono, at 100 % it is stereo.

Mix

Sets the level balance between the dry signal and the wet signal. If the effect is used as a send effect, set this parameter to the maximum value, as you can control the dry/effect balance with the send level.

Lock Mix Value

Activate this button (padlock symbol) next to the **Mix** parameter to lock the dry/wet balance while browsing through the available presets.

Modulation

Modulation allows you to enrich the reverb tail through subtle pitch modulations.

Modulation Rate

Specifies the frequency of the pitch modulation.

Modulation Depth

Sets the intensity of the pitch modulation.

Modulation Activate

Activates/Deactivates the chorusing effect.

RoomWorks

RoomWorks is a highly adjustable reverb plug-in for creating realistic room ambience and reverb effects in stereo and surround formats. The CPU usage is adjustable to fit the needs of any system. From short room reflections to cavern-sized reverb, this plug-in delivers high quality reverberation.

Input Filters

Low Frequency

Determines the frequency at which the low-shelving filter takes effect. Both the high and low settings filter the input signal prior to reverb processing.

High Frequency

Determines the frequency at which the high-shelving filter takes effect. Both the high and low settings filter the input signal prior to reverb processing.

Low Gain

Sets the amount of boost or attenuation for the low-shelving filter.

High Gain

Sets the amount of boost or attenuation for the high-shelving filter.

Reverb Character

Pre-Delay

Determines how much time passes before the reverb is applied. This allows you to simulate larger rooms by increasing the time it takes for the first reflections to reach the listener.

Size

Alters the delay times of the early reflections to simulate larger or smaller spaces.

Reverb Time

Allows you to set the reverb time in seconds.

Diffusion

Affects the character of the reverb tail. Higher values lead to more diffusion and a smoother sound, while lower values lead to a clearer sound.

Width

Controls the width of the stereo image. At a setting of 0 %, the output of the reverb is mono, at 100 % it is stereo.

Variation

Clicking this button generates a new version of the same reverb program using altered reflection patterns. This is helpful if some sounds are causing odd ringing or undesirable results. Creating a new variation often solves these issues. There are 1000 possible variations.

Hold

Activating this button freezes the reverb buffer in an infinite loop. You can create some interesting pad sounds using this feature.

Damping

Low Frequency

Determines the frequency below which low-frequency damping occurs.

High Frequency

Determines the frequency above which high-frequency damping occurs.

Low Level

Affects the decay time of the low frequencies. Normal room reverb decays quicker in the high- and low-frequency range than in the mid-range. Lowering the level

percentage causes low frequencies to decay quicker. Values above 100 % cause low frequencies to decay more slowly than the mid-range frequencies.

High Level

Affects the decay time of the high frequencies. Normal room reverb decays quicker in the high- and low-frequency range than in the mid-range. Lowering the level percentage causes high frequencies to decay quicker. Values above 100 % cause high frequencies to decay more slowly than the mid-range frequencies.

Envelope

Amount

Determines how much the envelope attack and release controls affect the reverb itself. Lower values have a more subtle effect while higher values lead to a more drastic sound.

Attack

The envelope settings in **RoomWorks** control how the reverb follows the dynamics of the input signal in a fashion similar to a noise gate or downward expander. Attack determines how long it takes for the reverb to reach full volume after a signal peak (in milliseconds). This is similar to a pre-delay, but the reverb is ramping up instead of starting all at once.

Release

Determines how long after a signal peak the reverb can be heard before being cut off, similar to a release time of a gate.

Output

Mix

Sets the level balance between the dry signal and the wet signal. If **RoomWorks** is used as an insert effect for an FX channel, you most likely want to set this to 100 % or use the **wet only** button.

Wet only

This button deactivates the **Mix** parameter, setting the effect to 100 % wet or affected signal. This button should normally be activated if **RoomWorks** is used as a send effect for an FX channel or a group channel.

Efficiency

Determines how much processing power is used for **RoomWorks**. The lower the value, the more CPU resources are used, and the higher the quality of the reverb. Interesting effects can be created with very high **Efficiency** settings (>90 %).

Export

Determines if during audio export **RoomWorks** uses the maximum CPU power for the highest quality reverb. During export, you may want to keep a higher efficiency setting to achieve a specific effect. If you want the highest quality reverb during export, make sure this button is activated.

Output meter

Shows the level of the output signal.

RoomWorks SE

RoomWorks SE is a smaller version of the **RoomWorks** plug-in. **RoomWorks SE** delivers high quality reverberation, but has fewer parameters and is less CPU demanding than the full version.

Pre-Delay

Determines how much time passes before the reverb is applied. This allows you to simulate larger rooms by increasing the time it takes for the first reflections to reach the listener.

Reverb Time

Allows you to set the reverb time in seconds.

Diffusion

Affects the character of the reverb tail. Higher values lead to more diffusion and a smoother sound, while lower values lead to a clearer sound.

Low Level

Affects the decay time of the low frequencies. Normal room reverb decays quicker in the high- and low-frequency range than in the mid-range. Lowering the level percentage causes low frequencies to decay quicker. Values above 100 % cause low frequencies to decay more slowly than the mid-range frequencies.

High Level

Affects the decay time of the high frequencies. Normal room reverb decays quicker in the high- and low-frequency range than in the mid-range. Lowering the level percentage causes high frequencies to decay quicker. Values above 100 % cause high frequencies to decay more slowly than the mid-range frequencies.

Mix

Sets the level balance between the dry signal and the wet signal. When using **RoomWorks SE** inserted in an FX channel, you most likely want to set this to 100 %.

Spatial + Panner Plug-ins

Imager

Imager allows you to expand or reduce the stereo width of your audio in up to 4 bands. This way, you can independently adjust the stereo image in defined frequency domains.

Bands

Sets the number of frequency bands.

Live

If this button is activated, a more analog-style filter bank is used. This mode introduces no latency and is better suited for live performances. If this button is deactivated, a more neutral-sounding linear phase filter bank is used, at the cost of introducing latency.

Frequency display

Shows a spectrum display and allows you to edit the band range and the output level for each band.

You can edit the output level of a band or the cutoff frequency between two bands by dragging the corresponding handle.

Output meter

Shows the level of the overall output signal.

Activate/Deactivate Band

Activates/Deactivates the corresponding frequency band.

Solo Band

Solos the corresponding frequency band.

Phase display

A phase scope for each band indicates the phase and amplitude relationship between the stereo channels. The phase scope works as follows:

- A vertical line indicates a perfect mono signal (the left and right channels are the same).
- A horizontal line indicates that the left channel is the same as the right, but with an inverse phase.
- A fairly round shape indicates a well balanced stereo signal. If the shape leans to one side, there is more energy in the corresponding channel.
- A perfect circle indicates a sine wave on one channel, and the same sine wave shifted by 45° on the other.

Generally, the more you can see a thread, the more bass is in the signal, and the more spray-like the display, the more high frequencies are in the signal.

The phase correlation meters below work as follows:

- The vertical bar shows the current phase correlation.
- With a mono signal, the meter shows +1, indicating that both channels are perfectly in phase.
- If the meter shows -1, the two channels are the same, but one is inverted.

Show/Hide Phase Scope

Shows/Hides the phase scopes and phase correlation meters for all bands.

Width

Sets the stereo width for the corresponding band.

Pan

Sets the left-right panning for the corresponding band.

Output

Sets the output level for the corresponding band.

MonoToStereo

MonoToStereo turns a mono signal into a pseudo-stereo signal. The plug-in can be used on mono audio or on stereo audio with equal channels.

NOTE

This plug-in works only on stereo tracks.

Delay

Increases the amount of differences between the left and right channels to further increase the stereo effect.

Width

Controls the width or depth of the stereo enhancement. Turn clockwise to increase the enhancement.

Mono

Sets the output to mono. This allows you to check for unwanted coloring of the sound which can occur when creating an artificial stereo image.

Color

Generates additional differences between the channels to increase the stereo enhancement.

StereoEnhancer

StereoEnhancer expands the stereo width of stereo audio material. It cannot be used with mono audio.

NOTE

This plug-in works only on stereo tracks.

Delay

Increases the amount of differences between the left and right channels to further increase the stereo effect.

Width

Controls the width or depth of the stereo enhancement. Turn clockwise to increase the enhancement.

Mono

Switches the output to mono, to check for possible unwanted coloring of the sound which sometimes can occur when enhancing the stereo image.

Color

Generates additional differences between the channels to increase the stereo enhancement.

Tools Plug-ins

Tuner

This is a guitar tuner.

To tune your instrument, connect it to an audio input, select **Tuner** as an insert effect, and activate **Monitor** for the corresponding track. Click **Mute** if you want to mute the output while tuning your instrument.

NOTE

Make sure that you deactivate any other effect that alters the pitch, such as a chorus or vibrato.

Tuner offers two different viewing modes, analog view and digital view.

- To toggle between analog view and digital view, click the **Toggle between Analog View and Digital View**  button.

Analog View

The graphical display indicates the currently played pitch as a note. The two arrows indicate any pitch deviation. The deviation is also shown in the upper area of the display. If the played note is flat of the pitch, the pitch indicator is located to the left. If the played note is sharp, the pitch indicator is located to the right.

Cent

Shows the deviation in pitch. A negative value indicates that the pitch is flat. A positive value indicates that the pitch is sharp.

Frequency

Shows the frequency of the played note.

Base

Shows the frequency of the base note A. Its default value is 440 Hz. You can adjust **Base** by ± 15 Hz.

Octave

Shows the octave of the played note.

Mute

Mutes/Unmutes the output signal.

Digital View

This view provides two tuner modes: **Strobe** and **Classic**.

In **Strobe** mode, a colored moving strobe indicates any pitch deviation. If the played note is flat, the strobe moves from right to left. If the played note is sharp, the strobe moves from left to right. The higher the deviation in pitch, the faster the strobe moves. If you play the correct pitch, the strobe stops moving and turns gray.

In **Classic** mode, an indicator shows any pitch deviation. If the played note is flat, the indicator is located left of the middle. If the played note is sharp, the indicator is located right of the middle. If you play the correct pitch, the indicator is located in the middle and turns gray.

Note

Shows the currently played pitch.

Cent

Shows the deviation in pitch. A negative value indicates that the pitch is flat. A positive value indicates that the pitch is sharp.

Base

Shows the frequency of the base note A. Its default value is 440 Hz. You can adjust **Base** by ± 15 Hz.

Octave

Shows the octave of the played note.

Frequency

Shows the frequency of the played note.

Mute

Mutes/Unmutes the output signal.

Strobe/Classic

Allows you to toggle the display between **Strobe** and **Classic** mode.

MIDI Effects

This chapter describes the included MIDI realtime effects and their parameters. How to apply and manage MIDI effects is described in the **Operation Manual**.

Arpache 5

A typical arpeggiator accepts a chord as input, and plays back each note in the chord separately, with the playback order and speed set by the user.

Play Order buttons

Allow you to select the playback order for the arpeggiated notes. If you select **User**, you can set the playback order manually using the 12 Play Order slots that are now shown at the bottom of the dialog.

Step Size

Determines the speed of the arpeggio, as a note value related to the project tempo. For example, setting this to **16** means the arpeggio is a pattern of 16 notes.

Length

Sets the length of the arpeggio notes, as a note value related to the project tempo.

- To create staccato arpeggios, set a smaller value for **Length** than for **Step Size**.
- To create arpeggio notes that overlap each other, set a greater value for **Length** than for **Step Size**.

Key Range

Determines the arpeggiated note range, in semitones counted from the lowest key you play. This works as follows:

- Any notes you play that are outside this range are transposed in octave steps to fit within the range.
- If the range is more than one octave, octave-transposed copies of the notes you play are added to the arpeggio (as many octaves as fit within the range).

Play Order slots

If the **User** play order is selected, you can use these slots to specify a custom playback order for the arpeggio notes: Each of the 12 slots corresponds to a position in the arpeggio pattern. For each slot, you specify which note should be played on that position by selecting a number. The numbers correspond to the keys you play, counted from the lowest key.

For example, if you play the notes C3-E3-G3 (a C major chord), 1 means C3, 2 means E3, and 3 means G3.

NOTE

You can use the same number in several slots, creating arpeggio patterns that are not possible using the standard play modes. You need to begin with the leftmost slot and then fill the slots to the right.

MIDI Thru

If this button is activated, the notes that you play pass through the plug-in and are sent out together with the arpeggiated notes.

Creating an Arpeggio

PROCEDURE

1. Select a MIDI track and activate monitoring (or record enable it) so that you can play through the track.
Make sure that the track is properly set up for playback to a suitable MIDI instrument.
 2. Select the arpeggiator as an insert effect for the track.
 3. Activate the arpeggiator.
 4. On the arpeggiator panel, use the **Step Size** setting to set the arpeggio speed.
 5. Use the **Length** setting to set the length of the arpeggio notes.
 6. Set the **Key Range** parameter to 12.
This makes the notes arpeggiate within an octave.
 7. Play a chord on your MIDI instrument.
Now, instead of hearing the chord, you hear the notes of the chord played one by one, in an arpeggio.
 8. Try the different arpeggio modes by clicking the **Play Order** buttons.
The symbols on the buttons indicate the playback order for the notes.
-

Arpache SX

This is a versatile and advanced arpeggiator, capable of creating anything from traditional arpeggios to complex, sequencer-like patterns.

Classic vs. Sequence Mode

Arpache SX has two different modes: **Classic** and **Sequence**. The **Classic** mode determines the basic behavior of Arpache SX. **Sequence** mode uses the events of an additional MIDI part as a pattern. This pattern forms the basis for the arpeggio, in conjunction with the MIDI input.

Classic Mode

Direction

Allows you to choose how the notes in the played chord should be arpeggiated.

One Shot Mode

Activate this option if you want the phrase to be played only once. If this option is deactivated, the phrase is looped.

Transpose

With a setting other than **Off**, the arpeggio is expanded upwards, downwards, or both (depending on the mode). This is done by adding transposed repeats of the basic arpeggio pattern.

Repeats

Sets the number of transposed repeats.

Pitch Shift

Determines the transposition of each repeat.

MIDI Thru

If this is activated, the played notes pass through the plug-in and are sent out together with the arpeggiated notes.

Step Size

Determines the resolution of the arpeggio, that is, its speed (in fixed note values or PPQ, if the **PPQ** button is activated). In Sequence mode you can also activate the **from sequence** option.

Length

Determines the length of the arpeggio notes (in fixed note values or PPQ, if the **PPQ** button is activated).

Max. Polyphony

Determines how many notes should be accepted in the input chord. The **All** setting means there are no limitations.

Sort by

If you play a chord, the arpeggiator sorts the notes in the chord in the order specified here. For example, if you play a C-E-G chord, with **Note Lowest** selected, C is the first note, E is the second and G the third. This affects the result of the **Arp Style** setting.

Velocity

Determines the velocity of the notes in the arpeggio. Using the slider you can set a fixed velocity, or you can activate the **via Input** button to use the velocity values of the notes in the chord you play. In Sequence mode you can also activate the **from sequence** option.

Sequence Mode

In Sequence mode, you can import a MIDI part into Arpache SX by dragging it from the Project window onto the **Drop MIDI Sequence** field on the right of the Arpache SX panel.

The notes in the dropped MIDI part are sorted internally, either according to their pitch if the **MIDI Seq. sort by pitch** checkbox is activated or according to their play order in the part. This results in a list of numbers. For example, if the notes in the MIDI part are C E G A E C and they are sorted according to pitch, the list of numbers reads 1 2 3 4 2 1. Here, there are 4 different notes/numbers and 6 trigger positions.

The MIDI input (the chord you play) generates a list of numbers, with each note in the chord corresponding to a number depending on the **Sort by** setting.

Furthermore, the two lists of numbers are matched – Arpache SX tries to play back the pattern from the dropped MIDI part but using the notes from the MIDI input. The result depends on the **Play Mode** setting.

Trigger

The whole pattern from the dropped MIDI file is played back, but transposed according to one of the notes in the MIDI input. Which note is used for transposing depends on the **Sort by** setting.

Trigger Cnt.

As above, but even if all keys are released, the phrase continues playing from the last position (where it stopped), if a new key is pressed on the keyboard. This is typically used when playing live through the Arpache SX.

Sort Normal

Matches the notes in the MIDI input with the notes in the dropped MIDI part. If there are fewer notes in the MIDI input, some steps in the resulting arpeggio remain empty.

Sort First

As above, but if there are fewer notes in the MIDI input, the missing notes are replaced by the first note.

Sort Any

As above, but if there are fewer notes in the MIDI input, the missing notes are replaced by random notes.

Arp. Style

As above, but if there are fewer notes in the MIDI input, the missing notes are replaced by the last valid note in the arpeggio.

Repeat

In this mode, the chords played are not separated into notes. Instead, they are used as is, and only the rhythm of the dropped MIDI part is used for playback.

NOTE

You can choose to keep the original note timing, note length, and note velocities from the dropped MIDI part, by selecting **from sequence** for the **Step Size**, **Length**, and **Velocity** options.

Auto LFO

This effect works like an LFO in a synthesizer, allowing you to send out continuously changing MIDI controller messages. One typical use for this is automatic MIDI panning, but you can select any MIDI continuous controller event type.

Waveform

Determines the shape of the controller curves that are sent out. You can click a waveform symbol or choose a value from the pop-up menu.

Wavelength

Sets the speed of Auto LFO, or rather the length of a single controller curve cycle. You can set this to rhythmically exact note values or PPQ values if the **PPQ** button is activated. The lower the note value, the slower the speed.

Controller Type

Determines which continuous controller type is sent out. Typical choices would include pan, volume, and brightness, but your MIDI instrument may have controllers mapped to various settings, allowing you to modulate the synth parameter of your choice. Check the MIDI implementation chart for your instrument for details.

Density

Determines the density of the controller curves that are sent out. The value can be set to **small**, **medium**, or **large**, or to rhythmically exact note values. The higher the note value, the smoother the controller curve.

Value Range

These sliders determine the range of controller values that are sent out, in other words, the bottom and top of the controller curves.

Beat Designer

Beat Designer is a MIDI pattern sequencer that allows you to create your own drum parts or patterns for a project. With **Beat Designer**, you can quickly and easily set up the drums for a project, by experimenting and creating new drum sequences from scratch.

Normally, you work on a short sequence, adjusting and modifying it while playing it back in a loop. The drum patterns can then either be converted to MIDI parts on a track or triggered using MIDI notes during playback.

Control Panel

- 1 Step display
- 2 Jump mode
- 3 Swing and Offset controls
- 4 Flam position settings
- 5 Pattern display
- 6 Swing settings

Patterns and Subbanks

Beat Designer patterns are saved as pattern banks. One pattern bank contains 4 subbanks which in turn contain 12 patterns each.

In the pattern display in the lower part of **Beat Designer**, subbanks and patterns are displayed graphically. To select a subbank, click a number (1 to 4) at the top of the display. To select a pattern within this subbank, click a key in the keyboard display below.

Initial Settings

The steps represent the beat positions in the pattern. You can specify the number of steps and the step resolution globally for a pattern.

- Click in the **Number of steps for this pattern** value field and enter a value. The maximum number of steps is 64.
- The playback length, that is, the note value for the steps, can be specified on the **Step Resolution** pop-up menu. On this menu, you can also set triplet values. These also affect the **Swing** setting.

[Swing Setting](#) on page 148

Selecting Drum Sounds

PROCEDURE

1. Click in the drum name field for a lane and select a drum sound from the pop-up menu. The available drum sounds depend on the selected drum map. If no drum map is selected for the track, the GM (General MIDI) drum names are used.
 2. To find the right sound, audition the selected drum sound by clicking the **Preview Instrument** button (the speaker icon).
-

Entering Drum Steps

PREREQUISITE

When working on drum patterns, it is a good idea to play back a section of the project in a loop while inserting the drum sounds. This allows you to hear the result immediately.

PROCEDURE

- Enter a drum step by clicking on the step field where you want to add a beat. For example, add a snare drum on each downbeat for a lane and a bass drum on a second lane.

NOTE

You can also click and drag to enter a continuous range of drum steps.

Removing Steps

PROCEDURE

- To remove a drum step, simply click on the corresponding field again.

NOTE

To remove a range of drum steps, click and drag over them.

Velocity Settings

When entering a drum step, the velocity setting of this step is determined by where you click: Click in the upper part of a step for the highest velocity setting, in the middle section for a medium velocity and in the lower part for the lowest velocity setting. In the display, the different velocity settings are indicated by different colors.

- To fine-tune the velocity setting for an existing drum step, click on it and drag up or down. The current velocity is indicated numerically while you drag.
- To fine-tune the velocity for a range of drum steps, click on the first step, drag up or down to enter velocity edit mode, and then drag sideways and up or down to modify the velocity for all the steps.

If you change the velocity for several steps at the same time, the relative velocity differences are kept for as long as possible (until the minimum or maximum setting is reached). The velocity for the steps is increased or decreased by the same amount.

NOTE

If you hold down **Shift** while dragging up or down, you can change the velocity for all steps on a lane.

- To create a crescendo or decrescendo for an existing range of drum steps, hold down **Alt/Opt**, click on the first step, drag up or down, and then drag to the left or right.

Editing Operations

- To move all drum steps on a lane, hold down **Shift**, click on the lane, and drag to the left or right.
- To invert a lane, that is, add drum sounds for all steps that were empty while removing all existing drum steps, hold down **Alt/Opt** and drag the mouse over the lane. This lets you create unusual rhythmic patterns.
- To copy the content of a lane onto another lane, hold down **Alt/Opt**, click in the section to the left of the lane that you want to copy, and drag.

Lane Handling

- To add a lane, click the **Add Instrument Lane** button at the bottom right of the last lane.
- To remove a lane, click the **Remove Instrument Lane** button in the controls section at the far right of the lane.
- To change the order of the drum lanes, click in an empty area in the section to the left of a lane, and drag it to another position.
- To mute or solo a lane, click the corresponding buttons to the left of the step display.

IMPORTANT

Lane operations always affect all patterns in the **Beat Designer** instance.

Pattern Functions Menu

Shift Left

Moves all steps of the current pattern on all lanes to the left.

Shift Right

Moves all steps of the current pattern on all lanes to the right.

Reverse

Reverses the pattern, so that it plays backwards.

Copy Pattern

Copies the pattern to the clipboard. Copied patterns can be pasted into another pattern subbank and even directly into the project.

Paste Pattern

Allows you to paste a complete pattern, for example, into another pattern subbank, or into another instance of **Beat Designer**. This is useful if you want to create variations based on existing patterns.

Clear Pattern

Resets the current pattern.

Insert Pattern at Cursor

Creates a MIDI part for the current pattern and inserts it in the **Project** window, at the position of the project cursor.

Insert Subbank at Cursor

Creates a MIDI part for each used pattern in the subbank and inserts the parts one after the other, starting at the project cursor.

Insert Pattern at Left Locator

Creates a MIDI part for the current pattern and inserts it in the **Project** window, at the left locator.

Insert Subbank at Left Locator

Creates a MIDI part for each used pattern in the subbank and inserts the parts one after the other, starting at the left locator.

Fill Loop with Pattern

Creates a MIDI part for the current pattern and inserts it in the **Project** window as often as needed to fill the current loop area.

NOTE

In the **Key Commands** dialog, you can set up key commands for the **Insert** options and the **Fill Loop** command. How to set up and use key commands is described in the **Operation Manual**.

RELATED LINKS

[Converting Patterns into MIDI Parts](#) on page 149

Swing Setting

This parameter can be used to create a swing or shuffle rhythm. This adds a more human feel to drum patterns that might otherwise be too static.

Swing offsets every second drum step for a lane. If a triplet step resolution is used, every third drum step is offset instead.

In the lower right section of the **Beat Designer** panel, you can find two **Swing** sliders. You can set up two swing settings with these sliders and then quickly switch between these during playback.

- To delay every second or third drum step in the pattern, drag a slider to the right.
- To make a drum step play earlier in the pattern, drag a slider to the left.
- To switch between the swing settings, click the **Swing** buttons to the right of the step display.

- To deactivate swing for a lane, click on the selected **Swing** buttons.

Flams

The **Flam** parameter lets you add flams, that is, short secondary drum hits just before or after the actual main drum beat. You can add up to three flams for each pattern step.

In the lower left section of the **Beat Designer** panel you can make settings for the flams you created.

The first position slider specifies the flam position for all steps containing one single flam, the second slider the flam positions for all steps containing two flams, and the third slider the flam position for all steps containing three flams.

Adding Flams

PROCEDURE

1. Click in the lower left corner of the step you want to add a flam to.
Little squares appear in the step when you point the mouse at it. If you click a step, the first square is filled to indicate that you added a flam.

2. Click again to add the second and third flam.
 3. In the lower left section of the **Beat Designer** panel, make settings for the flams that you created.
 - To add the flams before or after the drum step, drag a position slider to the left or right. If you add flams before the first drum step in a pattern, this is indicated in the display by a small arrow in the top left corner of this step. Starting playback at the normal pattern start would result in these flams not being played.
 - To set the velocity for the flams, use the vertical sliders to the right of the flam sliders.
 4. Start playback to hear the flams you created.
-

Offsetting Lanes

To the right of the step display, you can find the **Offset** sliders for the lanes. These allow you to offset all drum steps on this lane.

PROCEDURE

1. Drag a slider to the left to make the drum steps start a little earlier and to the right to let them start later.

For example, playing the bass drum or snare a little earlier allows you to add more urgency to the drums, while delaying these drum sounds results in a more relaxed drum pattern.
2. Experiment with the settings to find out which fit best in your project.

NOTE

This function can also be used to correct faulty drum samples: If a drum sound has an attack that is slightly late, simply adjust the **Offset** slider for the lane.

Using the Drum Patterns in Your Project

Converting Patterns into MIDI Parts

You can convert the drum patterns created in **Beat Designer** into a MIDI part by dragging them into the **Project** window.

PROCEDURE

1. Set up one or more patterns of the same subbank.
2. In the lower part of the window, click on a pattern or subbank and drag it onto a MIDI or instrument track in the **Project** window.
 - If you drag the pattern or subbank to an empty area in the **Project** window, a new MIDI track is created. This is an exact copy of the original track for which you opened **Beat Designer**.

- If you drag a single pattern into the **Project** window, one MIDI part is created containing the drum sounds of the pattern.
- If you drag a subbank into the **Project** window, several MIDI parts (one for each used pattern in the subbank) are created and inserted one after the other in the project.

IMPORTANT

Only the used patterns in a subbank are inserted. If you did not enter drum steps in a pattern, this is not converted into a MIDI part.

You can also use the **Pattern Functions** menu to insert patterns or subbanks into the project.

IMPORTANT

When you have created MIDI parts for your drum patterns this way, make sure to deactivate **Beat Designer**, to avoid doubling of the drums. **Beat Designer** continues to play as long as it is activated.

- If you import patterns that sound before the first step (due to flams or lane offsets), the MIDI part is lengthened accordingly.

The inserted MIDI parts can now be edited as usual in the project. For example, you can fine-tune your settings in the **Drum Editor**.

NOTE

Once a pattern is converted into a MIDI part, it cannot be opened in **Beat Designer** again.

RELATED LINKS

[Pattern Functions Menu](#) on page 147

Triggering Patterns

If you want to modify your drum patterns in **Beat Designer** while working on the project, you can trigger the patterns from within the project.

You can trigger the patterns in **Beat Designer** using note-on events. These can either be events on a MIDI track or be played live via a MIDI keyboard. Which pattern is triggered depends on the pitch of the MIDI notes. The trigger range is four octaves starting with C1 (that is, C1 to B4).

PROCEDURE

1. Open **Beat Designer** for a track.
2. Activate **Jump**.

In this mode, a MIDI note-on event triggers a new pattern.

- To trigger the patterns using a MIDI part containing trigger events, you can specify whether the pattern is switched instantly (at the moment the event is received) or at the next bar: Activate **Now** to switch patterns immediately. If **Now** is deactivated, patterns switch at the beginning of the next bar in the project.

- If you want to trigger the patterns live via a MIDI keyboard, the new patterns are always played when the next bar in the project is reached. Switching immediately would always produce an undesirable interruption in playback.
3. Play back the project and press a key on your MIDI keyboard to trigger the next pattern. The pattern starts at the next bar line.
 4. Create a MIDI part and enter notes at the positions in the project where you want to switch patterns.
Depending on the **Jump** mode setting, the new pattern is played instantly, or starts at the following bar.
 - You can also drag a pattern or subbank into the project with **Jump** mode activated to automatically create MIDI parts containing the trigger events.

NOTE

When triggering a pattern that contains sound before the first step (due to flams or lane offsets), these are taken into account as well.

Chorder

Chorder is a MIDI chord processor, allowing you to assign complete chords to single keys in a multitude of variations. These can then be played back live or using recorded notes on a MIDI track.

There are three main operating modes: **All Keys**, **One Octave**, and **Global Key**. You can switch between these modes using the **Chords** pop-up menu.

For every key, you can record up to 8 different chords or variations on so-called layers.

Operating Modes

In the lower left section of the **Chorder** window, you can choose an option from the **Chords** pop-up menu to decide which keys in the keyboard display are used to record your chords.

All Keys

In this mode, you can assign chords to each key on the keyboard display. If you play any of these keys, you hear the assigned chords instead.

One Octave

This mode is similar to the **All Keys** mode, but you can only set up chords for each key of a single octave, that is, up to eight different chords on twelve keys. If you play a note in a different octave, you hear a transposed version of the chords set up for this key.

Global Key

In this mode, you can set up chords for a single key only. These chords (that you recorded on C3) are then played by all keys on the keyboard, but transposed according to the note you play.

Chord Indicator Lane

At the top of the keyboard display, you find a thin lane with a small rectangle for each key that you can use to record a chord. These rectangles are shown in blue for all keys that already have chords assigned to them.

NOTE

In **Global Key** mode, the C3 key has a special marking, because this is the only key used in this mode.

RELATED LINKS

[Using Layers](#) on page 153

Entering Chords

PROCEDURE

1. Activate the **Learn** button at the top of the **Chorder** window to activate **Learn** mode. The chord indicator lane is now tinted red, indicating that it is active.

The keyboard display in **Learn** mode

The second layer in **Learn** mode

2. Select the key to which you want to assign a chord by clicking on it on the keyboard display or by pressing the key on a connected MIDI keyboard. The red bar now moves to the first layer, indicating that you are ready to record the first chord.

NOTE

In **Global Key** mode, you do not have to choose a trigger key. The first layer is activated automatically.

3. Play a chord on the MIDI keyboard and/or use the mouse to enter or change the chord in the layer display.
 - Any notes you enter are immediately shown in the **Chorder** display. The notes are shown in different colors, depending on the pitch.
 - If you are entering chords via a MIDI keyboard, **Chorder** learns the chord as soon as you release all keys of your MIDI keyboard.
As long as a key is pressed, you can continue looking for the right chord.
 - If more than one layer is shown, **Chorder** jumps automatically to the next layer where you can record another chord.
If all layers for a key are filled, the red bar jumps back to the keyboard display so that you can choose a different trigger key (in **Global Key** mode, the **Learn** mode is deactivated).
 - If you are entering chords with the mouse, **Chorder** does not jump to the next layer automatically.
You can select/deselect as many notes as you want and then click on another layer or deactivate the Learn mode to continue.
 4. Repeat the above with any other keys you want to use.
-

Using Layers

The **Layers** pop-up menu at the bottom right of the window allows you to set up chord variations in the layer display above the keyboard. This works with all three modes and provides up to 8 variations for each assignable key, that is, a maximum of 8 different chords in **Global Key** mode, 12 x 8 chords in **One Octave** mode and 128 x 8 chords in **All Keys** mode.

The different layers can be triggered by velocity or interval.

PROCEDURE

1. On the **Layers** pop-up menu, select **Velocity** or **Interval**. Set this to **Single Mode** if you want to set up only one chord per key.
 2. Use the slider below the **Layers** pop-up menu to specify how many variations you want to use.
 3. Enter the chords.
-

RESULT

Now you can play the keyboard and trigger the variations according to the selected layer mode.

RELATED LINKS

[Empty Layers](#) on page 154

Layer Modes

You can play the keyboard and trigger the variations according to the selected layer mode.

Velocity

The full velocity range (1 to 127) is divided into zones, according to the number of layers you specified. For example, if you are using 2 variations, 2 velocity zones are used: 1 to 63 and 64 to 127. Playing a note with velocity 64 or higher triggers the second layer, while playing a softer note triggers the first layer.

With the **Velocity spread** slider at the bottom right of the window, you can change the velocity ranges of the layers.

Interval

In this mode, **Chorder** plays one chord at a time. If the **Interval** mode is selected, you trigger a layer by pressing 2 keys on your keyboard. The lower key determines the base note for the chord. The layer number is determined by the difference between the 2 keys. To select layer 1, press a key one semitone higher than the base note, for layer 2, press a key two semitones higher, and so on.

Single Mode

Select this if you want to use only 1 layer.

Empty Layers

If you enter fewer chords than layers are available for a key, these layers are filled automatically when you deactivate the **Learn** mode.

The following applies:

- Empty layers are filled from bottom to top.
- If there are empty layers below the first layer with a chord, these are filled from top to bottom.

An example: If you have a setup with 8 layers, and you enter the chord C in layer 3 and G7 in layer 7, you get the following result: chord C in layers 1 to 6 and G7 in layers 7 and 8.

Resetting Layers

PROCEDURE

- In **Learn** mode, click **Reset layers** at the top left of the **Chorder** window.

RESULT

For the selected trigger key, all notes in the different layers are deleted.

Playstyle

From the **Playstyle** pop-up menu at the bottom of the panel, you can choose one of seven different styles that determine in which order the individual notes of the chords are played back.

simultaneous

In this mode, all notes are played back simultaneously.

fast up

In this mode, a small arpeggio is added, starting with the lowest note.

slow up

Similar to **fast up**, but using a slower arpeggio.

fast down

Similar to **fast up**, but starting with the highest note.

slow down

Similar to **slow up**, but starting with the highest note.

fast random

In this mode, the notes are played back in a rapidly changing random order.

slow random

Similar to **fast random**, but the note changes occur more slowly.

Compressor

This MIDI compressor is used for evening out or expanding differences in velocity.

Threshold

Only notes with velocities above this value are affected by the compression/expansion.

Ratio

Sets the amount of compression applied to the velocity values above the set threshold. Ratios greater than 1:1 result in compression. Ratios lower than 1:1 result in expansion.

Gain

Adds or subtracts a fixed value from the velocities. Since the maximum range for velocity values is 0 to 127, you can use the **Gain** setting to compensate, keeping the resulting velocities within the range. Typically, negative **Gain** settings are used for expansion and positive settings for compression.

Context Gate

Context Gate allows for selective triggering/filtering of MIDI data.

This effect features two modes: In **Poly Mode**, **Context Gate** recognizes certain chords that are played. In **Mono Mode**, only certain MIDI notes are let through.

Poly Mode

Polyphony Gate

Allows you to filter MIDI according to the number of pressed keys within a given key range. This can be used independently or in conjunction with the **Chord Gate** function.

- The **Key Range Limit** sliders set the key range. Only notes within this range are let through.
- The **Minimum Polyphony** value field allows you to specify the minimum number of notes required to open the gate.

Chord Gate

If **Chord Gate** is activated, only notes in recognized chords are let through. Two **Recognition** modes are available: **Simple** and **Normal**.

- In **Simple** mode, all standard chords (major/minor/b5/dim/sus/maj7 etc.) are recognized.
- **Normal** mode takes more tensions into account.

Mono Mode

Channel Gate

If this is activated, only single note events of the specified MIDI channel are let through. This can be used with MIDI controllers that can send MIDI on several channels simultaneously, for example, guitar controllers which send data for each string over a separate channel.

- You can set **Mono Channel** to a specific channel (1 to 16), or to **Any**, that is, no channel gating.

Velocity Gate

This can be used independently or in conjunction with the **Channel Gate** function. Notes are played back until another note within the set range is played.

- The **Key Range Limit** sliders set the key range. Only notes within this range are let through.
- Notes below the **Minimum Velocity** threshold value are gated.

Auto Gate Time

If there is no input activity, you can specify the time, after which note-off messages are sent for the notes that are playing.

Panic Reset

Sends an "All Notes Off" message over all channels, in case of hanging notes.

Learn Reset

If this is activated, you can specify a reset trigger event via MIDI. Whenever this specific MIDI event is sent, it triggers an "All Notes Off" message. When you have set the reset event, deactivate the **Learn Reset** button.

RELATED LINKS

[Application Examples](#) on page 157

Application Examples

Poly Mode

In this mode, you can use **Context Gate** to accompany yourself during a live guitar performance using a VST instrument. To do this, you might use a guitar-to-MIDI converter: You could then program **Context Gate**, for example, to allow only those notes to pass the gate that are part of a four-note chord. During your performance you would then play a four-note chord every time that you want to trigger the VST instrument. The instrument plays until the **Auto Gate Time** is reached and fades out. For more complex performances this can be combined with an arpeggiator, without having to use external pedals to trigger the effect.

Mono Mode

In this mode you could use **Context Gate** to trigger variations played with a drum machine/VST instrument. To do this, you need a guitar-to-MIDI converter: You could then filter the MIDI channel using the Input Transformer (optional) and program the **Context Gate** to allow only certain notes on your guitar to pass the gate (for example, beginning at the 12th band). When you now play one of these notes, the note-off command is not sent out and the corresponding note sounds until the note is played again, a new note is let through, or the **Auto Gate Time** is reached. This way you can trigger lots of different effects or notes using the high notes on your guitar without having to use an additional MIDI instrument.

Density

This generic control panel affects the density of the notes being played from or through the track. If this is set to 100 %, the notes are not affected. Density settings below 100 % randomly filter out or mute notes. Settings above 100 % randomly add notes that were played before.

MIDI Control

This generic control panel allows you to select up to 8 different MIDI controller types and set values for these. You can then use the plug-in as a control panel to adjust the sound of a MIDI instrument from within your host application.

- To select a controller type, use the pop-up menus on the right.
- To change the value of a controller type, enter a value in the value field or click the value field and drag the cursor up or down.
- To deactivate a controller, type **Off** in the value field or click the value field and drag the cursor down until the value field displays **Off**.

MIDI Echo

This is an advanced MIDI echo, which generates additional echoing notes based on the MIDI notes it receives. It creates effects similar to a digital delay, but also features MIDI pitch shifting and much more.

The effect does not echo the actual audio, but the MIDI notes which eventually produce the sound in the synthesizer.

Velocity Offset

Allows you to raise or lower the velocity values for each repeat so that the echo fades away or increases in volume (provided that the sound you use is velocity sensitive).

Pitch Offset

If you set this to a value other than 0, the echoing notes are raised or lowered in pitch, so that each successive note has a higher or lower pitch than the previous. The value is set in semitones.

For example, setting this to -2 causes the first echo note to have a pitch two semitones lower than the original note, the second echo note two semitones lower than the first echo note, and so on.

Repeats

The number of echoes (1 to 12) of each incoming note.

Beat Align

During playback, this parameter quantizes the position of the first echo note. You can either set this to rhythmically exact values or activate the **PPQ** button and choose a **PPQ** value.

Setting this to 1/8, for example, causes the first echo note to sound on the first eighth position after the original note.

NOTE

The echo time can also be affected by the **Delay Decay** parameter.

NOTE

During live mode, this parameter has no effect since the first echo is always played together with the note event itself.

Delay

The echoed notes are repeated according to this value. You can either set this to rhythmically exact values or activate the **PPQ** button and choose a PPQ value. This makes it easy to find rhythmically relevant delay values, but still allows for experimental settings in between.

Delay Decay

Adjusts how the echo time changes with each successive repeat. The value is set as a percentage.

- If this is set to 100 % the echo time is the same for all repeats.
- If you raise the value above 100 %, the echoing notes play with gradually longer intervals, that is, the echo becomes slower.
- If you lower the value below 100 %, the echoing notes become gradually faster, like the sound of a bouncing ball.

Length

Sets the length of the echoed notes. This can either be identical with the length of the original notes (parameter set to its lowest value) or the length you specify manually. You can either set this to rhythmically exact values (displayed as note values – see the table below) or activate the **PPQ** button and choose a PPQ value.

NOTE

The length can also be affected by the **Length Decay** parameter.

Length Decay

Adjusts how the length of the echoed notes changes with each successive repeat. The higher the setting, the longer the echoed notes.

About Ticks and Note Values

The timing and position-related parameters (**Delay**, **Length**, and **Beat Align**) can all be set in ticks. There are 480 ticks to each quarter note. The parameters allow you to step between the rhythmically relevant values. The following table shows the most common note values and the corresponding number of ticks.

Note Value	Ticks
1/32 note	60
1/16 note triplet	90
1/16 note	120
1/8 note triplet	160
1/8 note	240
Quarter note triplet	320
Quarter note	480
Half note	960

MIDI Modifiers

This plug-in is essentially a duplicate of the **MIDI Modifiers** section in the **Inspector**. This can be useful, for example, if you need extra **Random** or **Range** settings.

The **MIDI Modifiers** effect also includes the **Scale Transpose** function that is not available among the track parameters.

Scale Transpose

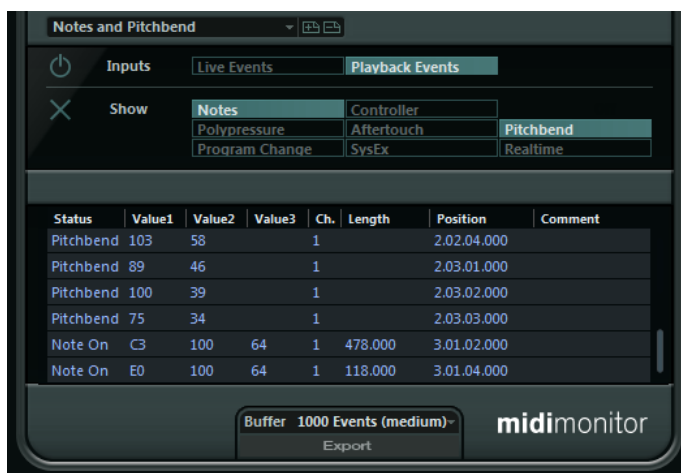

Allows you to transpose each incoming MIDI note, so that it fits within a selected musical scale. The scale is specified by selecting a key (C, C#, D, etc.) and a scale type (major, melodic or harmonic minor, blues, etc.).

- To deactivate **Scale Transpose**, select **No Scale** from the **Scale** pop-up menu.

MIDI Monitor

This effect monitors incoming MIDI events.

You can choose whether to analyze live or playback events and which types of MIDI data are to be monitored. Use this, for example, to analyze which MIDI events are generated by a MIDI track,

or to find suspicious events, such as notes with velocity 0 that certain MIDI devices might fail to interpret as note-off events.

Inputs Section

In this section, you can choose whether to monitor live events or playback events.

Show Section

Here, you can activate/deactivate the different types of MIDI events. If you choose **Controller**, you can also define which type of controller to monitor.

Data Table

In the table in the lower section of the window, you see detailed information about the monitored MIDI events.

Buffer Pop-up Menu

This is the maximum number of events that is kept in the list of monitored events. Once this list is full, the oldest entries are deleted when new events are received.

NOTE

The larger the buffer, the more processing resources are required.

Export

Allows you to export the monitoring data as a simple text file.

Record Events

This button to the left of the **Inputs** section allows you to start or stop the monitoring of MIDI events.

Clear List

This button to the left of the **Show** section allows you to clear the table of recorded MIDI events.

Micro Tuner

Micro Tuner lets you set up a different microtuning scheme for the instrument, by detuning each key.

- Each detune slider corresponds to a key in an octave (as indicated by the keyboard display). Adjust a detune field to raise or lower the tuning of that key, in cents (hundreds of a semitone).
- You can set the root note that is taken as a reference for the detuning.
- You can adjust all keys by the same amount by keeping **Alt/Opt** pressed.

Micro Tuner comes with a number of presets, including both classical and experimental microtuning scales.

Note to CC

This effect generates a MIDI continuous controller event for each incoming MIDI note. The value of the controller event corresponds to the velocity of the MIDI note, which is then used to control the selected MIDI controller (by default CC 7, Main Volume). For each note end, another controller event with the value 0 is sent. The incoming MIDI notes pass through the effect unaffected.

The purpose of this plug-in is to generate a gate effect. This means that the notes that are played control something else. For example, if **Main Volume** (CC 7) is selected, notes with low velocity lower the volume in the MIDI instrument, while notes with a high velocity raise the volume.

IMPORTANT

A controller event is sent out each time a new note is played. If high and low notes are played simultaneously, this may lead to confusing results. Therefore, the **Note to CC** effect is best applied to monophonic tracks.

Quantizer

This effect allows you to apply quantizing in realtime. This makes it easier to try out different settings when creating grooves and rhythms.

Quantizing is a function that changes the timing of notes by moving them towards a quantize grid. For example, this grid may consist of straight sixteenth notes, in which case the notes all get perfect sixteenth note timing.

NOTE

The main **Quantize** function in your Steinberg DAW is described in the **Operation Manual**.

Quantize Note

Sets the note value on which the quantize grid is based. Straight notes, triplets, and dotted notes are available. For example, 16 means straight sixteenth notes and 8T means eighth note triplets.

Swing

Allows you to offset every second position in the grid, creating a swing or shuffle feel. The value is a percentage – the higher you set this, the farther to the right every even grid position is moved.

Strength

Determines how close the notes should be moved to the quantize grid. If this is set to 100 %, all notes are forced to the closest grid position. Lowering the setting gradually loosens the timing.

Delay

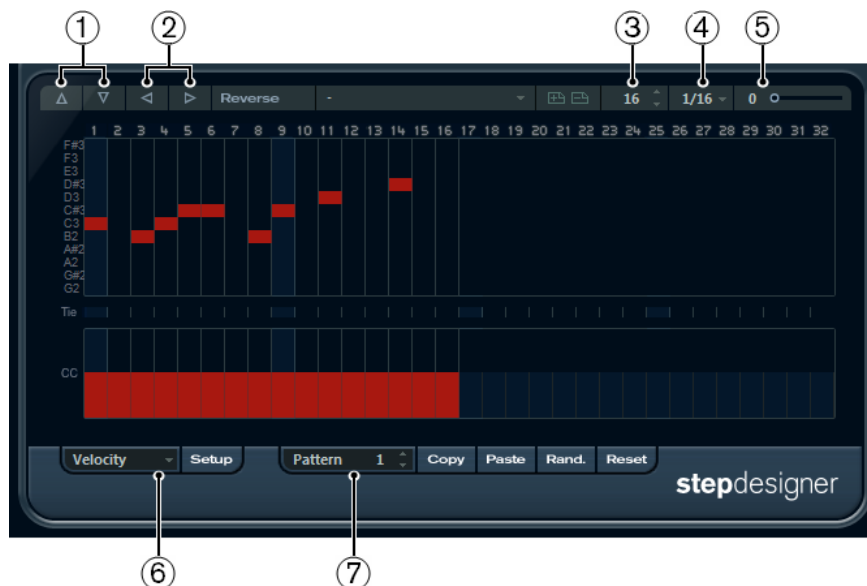

Sets the delay time in milliseconds. This delay can be automated.

Realtime quantize

During live mode, this option can be used to change the timing of the notes that are played so that they fit the quantize grid.

StepDesigner

StepDesigner is a MIDI pattern sequencer that sends out MIDI notes and additional controller data according to the defined pattern. It does not make use of the incoming MIDI, other than automation data (such as recorded pattern changes).

- 1 Shift octave up/down
- 2 Shift steps left/right
- 3 Number of steps
- 4 Step size
- 5 Swing
- 6 Controller pop-up menu
- 7 Pattern selector

Creating a Basic Pattern

PROCEDURE

1. Use the **Pattern** selector to choose which pattern to create. Each **StepDesigner** can hold up to 200 different patterns.
2. Use the **Step size** setting to specify the resolution of the pattern. This setting determines the step length.

3. Specify the number of steps in the pattern with the **Number of steps** setting.
The maximum number of steps is 32. For example, setting **Step size** to 16 and **Number of steps** to 32 creates a 2 bar pattern with sixteenth note steps.
4. Click in the note display to insert notes.
You can insert notes on any of the 32 steps, but **StepDesigner** only plays back the number of steps set with the **Step size** parameter.
 - The display spans one octave (as indicated by the pitch list to the left). You can scroll the displayed octave up or down by clicking in the pitch list and dragging up or down.
This way you can insert notes at any pitch.

- To remove a note from the pattern, click on it again.

NOTE

Each step can contain one note only – **StepDesigner** is monophonic.

RESULT

If you now start playback in your host application, the pattern plays as well, sending out MIDI notes on the track's MIDI output and channel (or, if you activated **StepDesigner** as a send effect, on the MIDI output and channel selected for the send in the **Inspector**).

Adding Controller Curves

PROCEDURE

1. Open the **Controller** pop-up menu and select a controller.
The selection is displayed in the lower controller display.
2. Click in the controller display to draw events.
The MIDI controller events are sent out during playback along with the notes.

NOTE

If you drag a controller event bar all the way down, no controller value is sent out on that step.

Setting Up the Controller Menu

You can specify which two controller types (filter cutoff, resonance, volume, etc.) should be available on the **Controller** pop-up menu.

PROCEDURE

1. Click **Setup**.
2. Select the controllers that you want to have available in the **Controller** pop-up menu and click **OK**.

This selection is global, that is, it applies to all patterns.

Adjusting the Step Length

- To make notes shorter, select **Gate** on the **Controller** pop-up menu and lower the bars in the controller display.
If a bar is set to its maximum value, the corresponding note is the full length of the step.
- To make notes longer, you can tie two notes together. This is done by inserting two notes and clicking in the **Tie** column for the second note.
If 2 notes are tied, the second note is not triggered – the previous note is lengthened instead. Also, the second note gets the same pitch as the first note. You can add more notes and tie them in the same way, creating longer notes.

Other Pattern Functions

Shift Octave up/down

Shifts the entire pattern up or down in octave steps.

Shift Steps left/right

Moves the pattern one step to the left or right.

Reverse

Reverses the pattern, so that it plays backwards.

Copy/Paste

Allow you to copy the current pattern and paste it in another pattern location (in the same **StepDesigner** instance or another).

Reset

Clears the pattern, removing all notes and resetting controller values.

Randomize

Generates a completely random pattern.

Swing

Offsets every second step, creating a swing or shuffle feel. The value is a percentage – the higher you set this, the farther to the right every even step is moved.

Presets

Allows you to load/save presets for the effect.

NOTE

A stored preset contains all 200 patterns in **StepDesigner**.

Automating Pattern Changes

You can create up to 200 different patterns in each **StepDesigner** instance.

Typically, you want the pattern selection to change during the project. You can accomplish this by automating the pattern selector, either in realtime by activating **Write** automation and switching patterns during playback or by drawing on the automation track for the MIDI track.

Note that you can also press a key on your MIDI keyboard to change patterns. For this, you have to set up **StepDesigner** as an insert effect for a record enabled MIDI track. Press C1 to select pattern 1, C#1 to select pattern 2, D1 to select pattern 3, D#1 to select pattern 4 and so on. You can record these pattern changes as note events on a MIDI track.

PROCEDURE

1. Select a MIDI track or create a new one and activate **StepDesigner** as an insert effect.
2. Set up several patterns.
3. Activate the **Record** button and press keys on your keyboard to select the corresponding patterns.

The pattern changes are recorded on the MIDI track.

4. Stop recording and play back the MIDI track.

RESULT

You now hear the recorded pattern changes.

NOTE

You can only automate the first 92 patterns.

Track Control

The **Track Control** effect contains three control panels for adjusting parameters on a GS or XG compatible MIDI device. The Roland GS and Yamaha XG protocols are extensions of the General MIDI standard, allowing for more sounds and better control of various instrument settings. If

your instrument is compatible with GS or XG, **Track Control** allows you to adjust sounds and effects in your instrument from within your host application.

The Available Control Panels

You select the control panel from the pop-up menu at the top of the effect panel. The following panels are available:

GS 1

Contains effect sends and various sound control parameters for use with instruments compatible with the Roland GS standard.

XG 1

Contains effect sends and various sound control parameters for use with instruments compatible with the Yamaha XG standard.

XG 2

Global settings for instruments compatible with the Yamaha XG standard.

About the Reset and Off Buttons

You find two buttons labeled **Off** and **Reset** at the top of the control panel:

- Clicking the **Off** button sets all controls to their lowest value, without sending out any MIDI messages.
- Clicking the **Reset** button resets all parameters to their default values, and sends out the corresponding MIDI messages.

GS 1

The following controls are available if the **GS 1 Controls** mode is selected:

Send 1

Send level for the reverb effect.

Send 2

Send level for the chorus effect.

Send 3

Send level for the variation effect.

Attack

Adjusts the attack time of the sound. Lowering the value shortens the attack, while raising it makes the attack time longer.

Decay

Adjusts the decay time of the sound. Lowering the value shortens the decay, while raising it makes the decay longer.

Release

Adjusts the release time of the sound. Lowering the value shortens the release, while raising it makes the release time longer.

Cutoff

Adjusts the filter cutoff frequency.

Resonance

Sets the sound characteristic of the filter. With higher values, a ringing sound is heard.

Express

Allows you to send out expression pedal messages on the track's MIDI channel.

Ch. Press

Allows you to send out aftertouch (channel pressure) messages on the track's MIDI channel. This is useful if your keyboard cannot send aftertouch, but you have sound modules that respond to aftertouch.

Breath

Allows you to send breath control messages on the track's MIDI channel.

Modul.

Allows you to send modulation messages on the track's MIDI channel.

XG 1

The following controls are available if the XG 1 mode is selected.

Send 1

Send level for the reverb effect.

Send 2

Send level for the chorus effect.

Send 3

Send level for the variation effect.

Attack

Adjusts the attack time of the sound. Lowering this value shortens the attack, while raising it makes the attack time longer.

Release

Adjusts the release time of the sound. Lowering this value shortens the release, while raising it makes the release time longer.

Harm.Cont

Adjusts the harmonic content of the sound.

Bright

Adjusts the brightness of the sound.

CutOff

Adjusts the filter cutoff frequency.

Resonance

Sets the sound characteristic of the filter. With higher values, a ringing sound is heard.

XG 2

In this mode, the parameters affect global settings in the instruments. Changing one of these settings for a track affects all MIDI instruments connected to the same MIDI output, regardless of the MIDI channel setting of the track. Therefore, it might be a good idea to create an empty track and use this only for these global settings.

Eff. 1

Allows you to select which type of reverb effect should be used: No effect (reverb deactivated), Hall 1-2, Room 1-3, Stage 1-2, or Plate.

Eff. 2

Allows you to select which type of chorus effect should be used: No effect (chorus deactivated), Chorus 1–3, Celeste 1–3, or Flanger 1–2.

Eff. 3

Allows you to select one of a large number of variation effect types. Select **No Effect** to deactivate the variation effect.

Reset

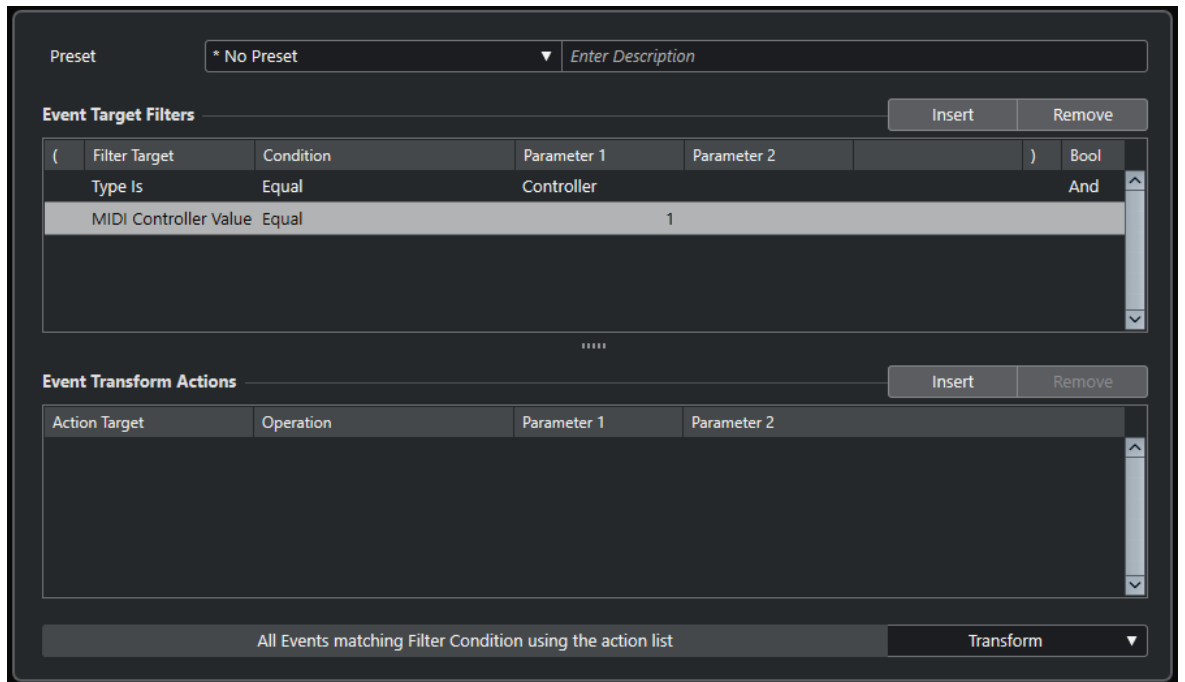

Sends an XG reset message.

MastVol

Controls the master volume of an instrument. Normally, you should leave this at its highest position and set the volumes individually for each channel (with the volume faders in the **MixConsole** or in the **Inspector**).

Transformer

Transformer is a realtime version of the **Logical Editor**. With this you can perform very powerful MIDI processing on the fly, without affecting the actual MIDI events on the track.

The **Logical Editor**, the **Track Input Transformer**, and the **Project Input Transformer** are described in the **Operation Manual**.

Included VST Instruments

The included VST instruments are described in separate documents.
